

The bridge to possible

Wi-Fi 6E Adoption and Sneak Peek into the Future With Wi-Fi 7

Anand Gurumurthy, Sr. Technical Leader,
Technical Marketing

BRKEWN-2024

CISCO *Live!*

#CiscoLive

Cisco Webex App

Questions?

Use Cisco Webex App to chat with the speaker after the session

How

- 1 Find this session in the Cisco Live Mobile App
- 2 Click “Join the Discussion”
- 3 Install the Webex App or go directly to the Webex space
- 4 Enter messages/questions in the Webex space

Webex spaces will be moderated by the speaker until June 7, 2024.

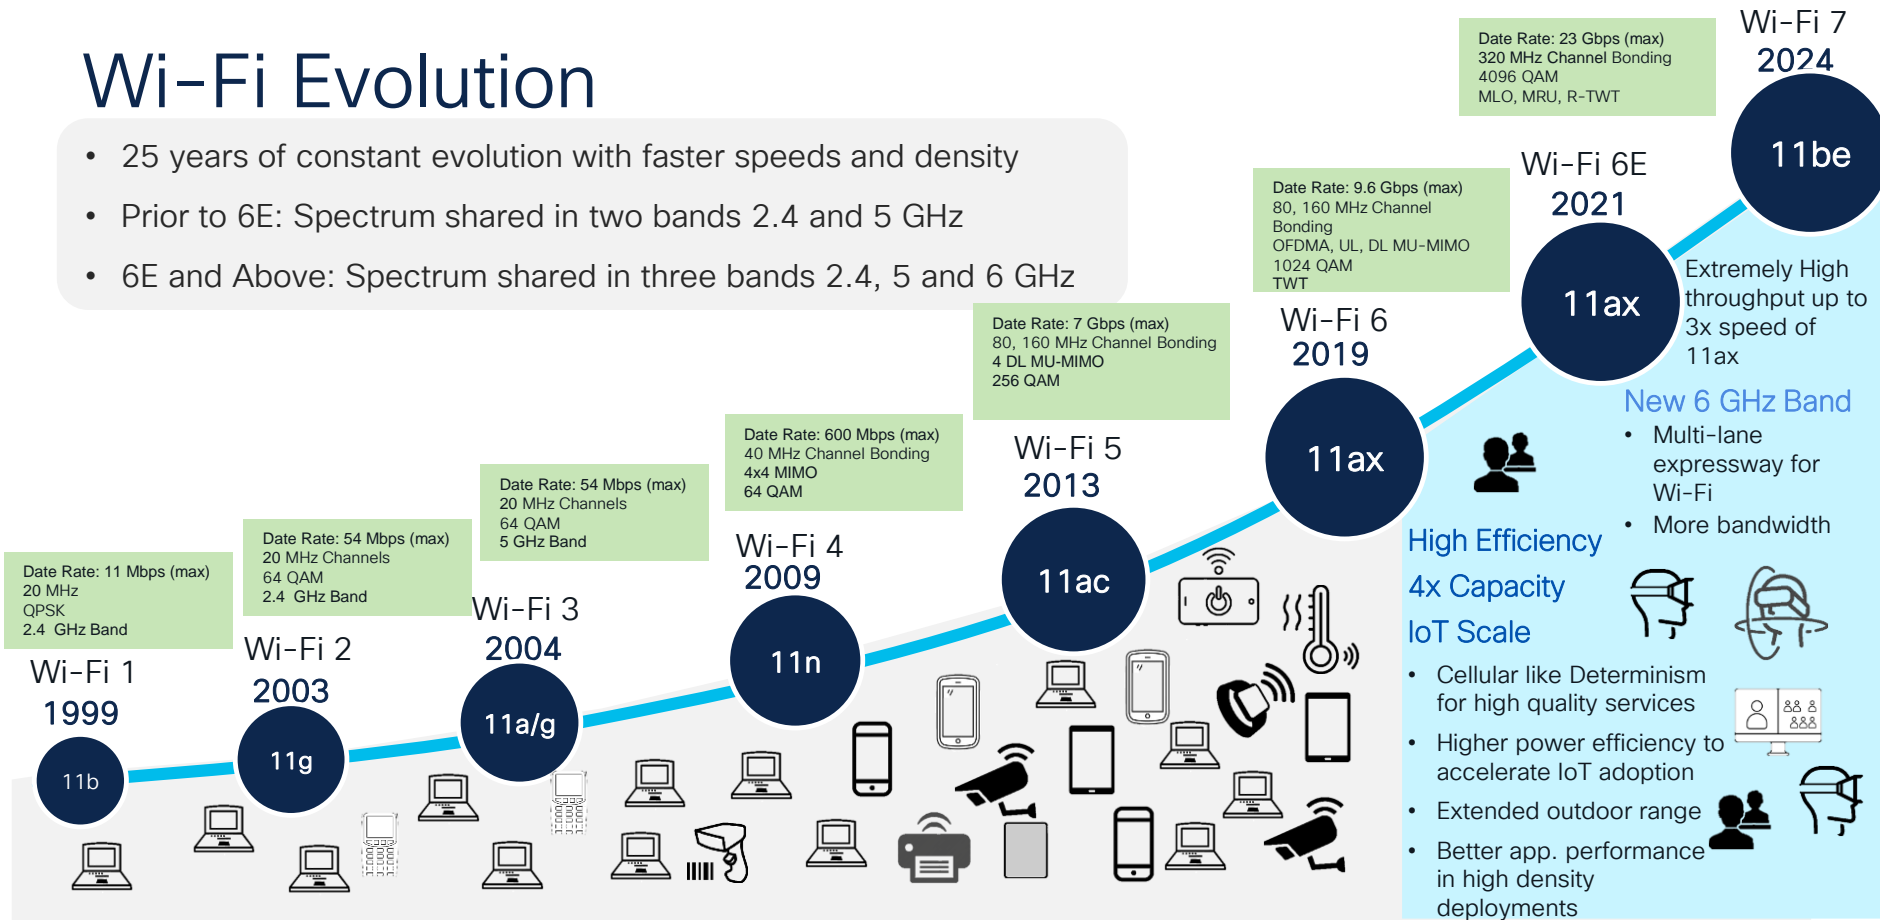

Agenda

- Explore Wi-Fi 6E
- Deployment & Migration Considerations
- Get to know Wi-Fi 7
- The Wi-Fi 6E vs Wi-Fi 7 Dilemma!

Wi-Fi Evolution

- 25 years of constant evolution with faster speeds and density
- Prior to 6E: Spectrum shared in two bands 2.4 and 5 GHz
- 6E and Above: Spectrum shared in three bands 2.4, 5 and 6 GHz

Why Wi-Fi 6E ?

Primitive applications of the past to

Immersive Experiences of Today...

Webex Hologram <https://www.youtube.com/watch?v=YEx7h0NKnXE>

and Tomorrow...

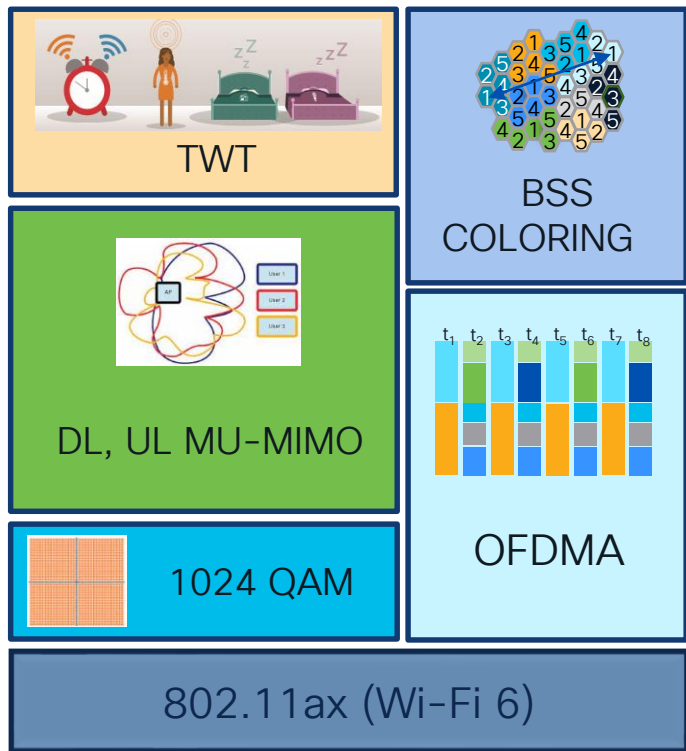

What is the Problem?

- Existing 2.4 GHz and 5 GHz spectrum is congested
- Interference
- Limited re-usable channels
- No way to use 80 or 160 MHz channels

Wi-Fi 6E

Wi-Fi 6 and 6GHz are friends!

1

Additional Spectrum

1200 MHz (5.925 to 7.125 MHz) – US
500 MHz (5.925 to 6.425) – EU

2

Security Upgrade

WPA3 Mandatory
Improves Security

3

Clean RF

(Fixed Mobile Service Operators in
UNI-5 and UNI-7)

4

No Legacy (Slow) Devices

Improves performance

5

Protocol Enhancements

Airtime Efficiency

6

Wider RF Channels

80 MHz channels – 1200 MHz
40 MHz channels – 500 MHz

With Wi-Fi 6E

Setting the stage

Setting the stage

- New 6 GHz Band
- Regulatory Considerations
- Protocol enhancements

Wi-Fi 6E 6GHz Around the World

Global availability of 6 GHz band for Wi-Fi

■ Adopted 5925-7125 MHz

■ Adopted 5925/45-6425 MHz,
and evaluating 6425-7125 MHz

■ Adopted 5925-6425 MHz

■ Recommended 5925-6425 MHz

■ Under consultation

Region 2

1200 MHz

- Canada
- USA
- Honduras
- Costa Rica
- Brazil
- Peru
- Dominican Republic
- Colombia
- Argentina
- El Salvador
- 500 MHz (& evaluating 1200 MHz)
- Chile
- Mexico

Region 1

1200 MHz

- Saudi Arabia
- 500 MHz (& evaluating 1200 MHz)
- CEPT Area
- European Union (480 MHz)
- Qatar
- United Kingdom
- 500 MHz
- Morocco
- UAE
- Jordan
- Kuwait
- Kenya
- Israel
- Mauritius (480 MHz)
- Bahrain
- Togo
- Russia
- South Africa
- Namibia
- Africa / ATU

Region 3

1200 MHz

- South Korea
- 500 MHz (& evaluating 1200 MHz)
- Australia
- Japan
- Taiwan
- Thailand
- 500 MHz
- Hong Kong
- Malaysia
- New Zealand
- Singapore

cisco *Live!*

The new 6 GHz band :

5955 – Central Frequency of the first 20 MHz channel
 → Starting at 5925 MHz +
 20 MHz of guard band +
 10 MHz to get to the center of the first 20 MHz channel

6 GHz – New Device Classes

Wi-Fi 6E introduces new device classes for optimized capability

Low Power Indoor AP

- Indoor Only
- Integrated Antenna Required
- Can use the full 1200 MHz
- Wired Power

Standard Power AP

- Indoor or Outdoor
- Integrated or External Antenna
- UNII-5 and UNII-7 Only (US)
- Requires AFC

Very Lower Power AP

- Mobile Indoor or Outdoor
- Limited Range
- Can use the full 1200 MHz
- Does not require AFC

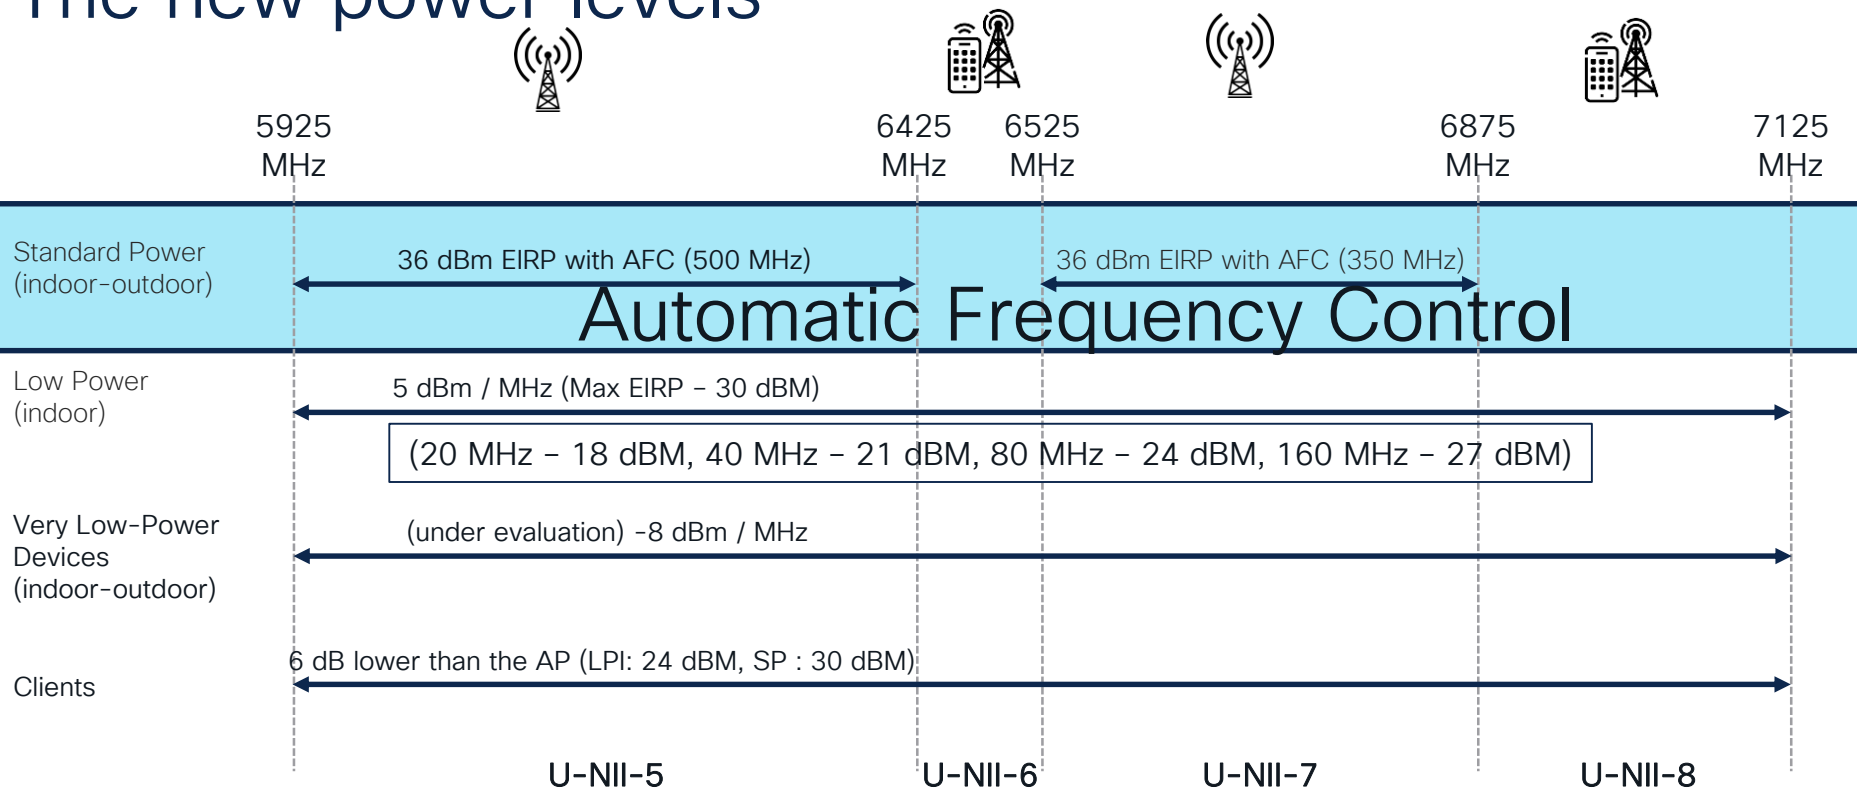

Client Devices

- Indoor or Outdoor
- Only Indoor under control of LPI AP
- 6 dBm lower power than AP

Regulations vary by country

The new power levels

Low-Power Access Points (indoor)

6 GHz power is measured as **Power Spectral Density (PSD)** a
Maximum of 5 dBm/MHz is permitted for LPI
(*Power Spectral Density* – Amount of power over a given bandwidth)

5 dBm = 3.162278 mW

$3.162278 \text{ mW} \times 20 \text{ MHz} = 63.24556 \text{ mW} = 18 \text{ dBm}$

$3.162278 \text{ mW} \times 40 \text{ MHz} = 126.4911 \text{ mW} = 21 \text{ dBm}$

Client power also has a PSD rule of 6 dB less than the AP's
max EIRP

Note: Indoor AP's with an external antenna, must operate
under the Standard Power rules, LPI only applies to I models

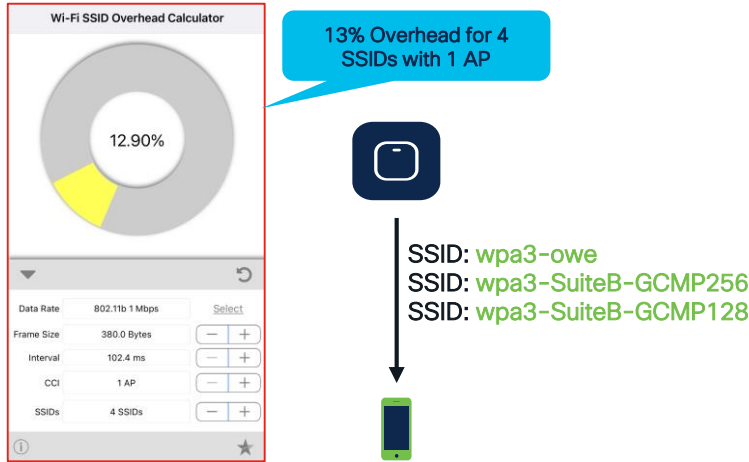

| Channel BW | AP EIRP | Client EIRP |
|------------|---------|-------------|
| 20 MHz | 18 dBm | 12 dBm |
| 40 MHz | 21 dBm | 15 dBm |
| 80 MHz | 24 dBm | 18 dBm |
| 160 MHz | 27 dBm | 21 dBm |

Protocol Enhancements

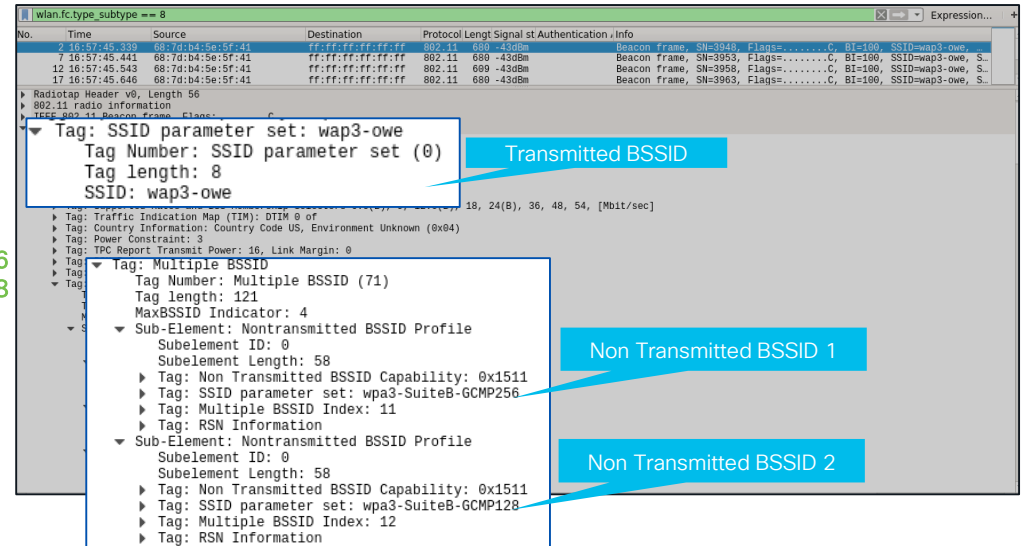

Multiple BSSID

- Capability originally specified in 802.11v
- Combines multiple SSID information in a single beacon frame

- Conserves Airtime
- Mandated in Wi-Fi 6E

Wi-Fi 6E – New AP Discovery Mechanisms

Out of Band

Reduced Neighbor Report

Co-located Discovery

In Band

Passive Scan:

Fast Link Setup (FILS) Discovery Frames
Unsolicited Broadcast Probe Response Frames

Active Scan:

Preferred Scanning Channels (PSC)

Reduced Neighbor Report

Co-located “Neighbor” 6 GHz radio information in Beacon and Probe Response of 2.4 and 5 GHz radios.

Preferred Scanning Channels (PSC)

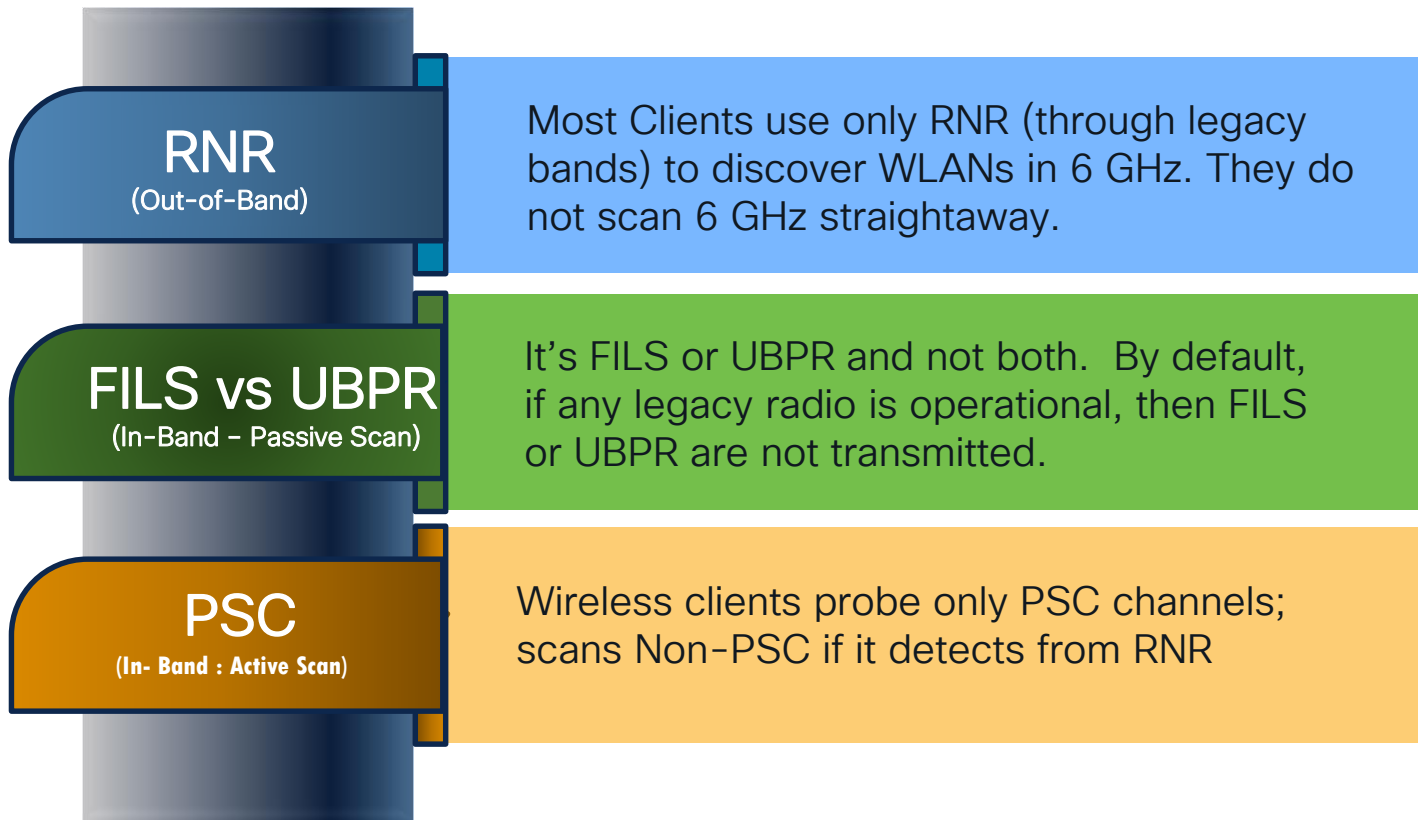

- Every fourth 20MHz channel designated for active probing by Wi-Fi 6E Clients; restricts scanning to 15 channels, instead of 59.
- PSC channels serve as the primary channel for channel bonding in 80 MHz

PSC Channel List:

5, 21, 37, 53, 69, 85, 101, 117, 133, 149, 165, 181, 197, 213 and 229

Key Takeaways

Section Summary

1

New 6 GHz Band: (5925 – 7125 MHz)
1200 MHz or 500 MHz

2

Device Classes: Low Power Indoor AP, Standard Power AP and Very Low Power AP

3

Power Levels: 36 dBm Max EIRP for SP,
5 dBm/MHz PSD for LPi

4

AP Discovery: RnR (Out-of-Band), FILS,
UBPR & PSC (In-Band)

AP Deployment

Setting the stage

- New 6 GHz Band
- Regulatory Considerations
- Protocol enhancements

AP Deployment

Network Infrastructure

Catalyst AP to Switch connection

AP negotiates power, speed and duplex at boot time via CDP/LLDP

MGig switchport is recommended as Wi-Fi 6/6E speed may exceed 1 Gbps

Cabling: Cat 6/6A recommended.
Cat 5e can support up to 5Gbps

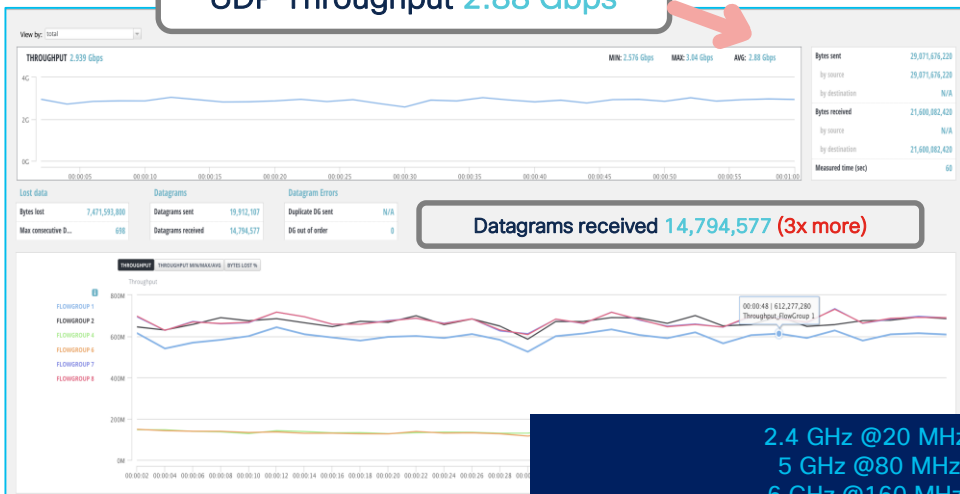

CDP = Cisco Discovery Protocol
LLDP = Link Layer Discovery Protocol
Cat = Category (of ethernet cable)

Wi-Fi 6E Performance Comparison

5 Gig (mGig) AP Uplink vs. 1 Gig AP Uplink

Wi-Fi 6E Performance with **mGig (5 Gig) Switch**

UDP Throughput **2.88 Gbps**

Datagrams received **14,794,577 (3x more)**

Wi-Fi 6E Performance with **Gigabit Switch**

UDP Throughput **950 Mbps**

Datagrams received **4,880,770**

2.4 GHz @20 MHz w 2x2ss Intel AX200
5 GHz @80 MHz w 2x2ss Intel AX200
6 GHz @160 MHz w 1x2ss Intel AX210

Catalyst AP C9136 to Switch connection

AP C9136

C9136 has two mGig uplink ports

Dual port is for PoE power and uplink redundancy with hitless failover

Switchport and AP can be configured for LAG or standalone ports (default)

mGig = multi gigabit ethernet
PoE = Power over Ethernet
LAG = Link Aggregation Group

Catalyst AP C9136 to Switch connection

- When configured as standalone ports, one becomes **active** and the other one **standby**
 - If power is equal on both ports, Port 0 becomes **active**. Otherwise, the one with more power
- Traffic is exchanged on **active** port using active **MAC A** (CAPWAP, ARP, etc.)
- **Standby** port only exchanges CDP/LLDP messages with its own **MAC S**, no other traffic

MAC = Media Access Control
ARP = Address Resolution Protocol
CAPWAP = Control and Provisioning of Wireless Access Points

Catalyst AP C9136 to Switch connection

- When configured as standalone ports, one becomes **active** and the other one **standby**
 - If power is equal on both ports, Port 0 becomes **active**. Otherwise, the one with more power
- Traffic is exchanged on **active** port using active **MAC A** (CAPWAP, ARP, etc.)
- **Standby** port only exchanges CDP/LLDP messages with its own **MAC S**, no other traffic
- In case of active port failure, **standby** becomes **active** and exchanges traffic using MAC A. Minimal to zero traffic interruption

Catalyst AP C9136 to Switch connection

- When configured with standalone ports, you have two options...
- Dual-home to two different switches
 - Recommend to connect to switches in different IDF, whenever possible
- Single-home to one logical switch (Stack Wise, vPC, Multi-layer switch, etc.)
 - Recommend to connect to two different members of the stack or line-cards
- In both scenario, the switchports must be configured in the same VLAN

VLAN = Virtual Local Area Network
IDF = Intermediate Distribution Frame
vPC = virtual Port Channel

Catalyst AP C9136 to Switch connection

- When configured with LAG, both ports are **Active**
- LAG must be configured on both AP and switchport side.
- AP supports static LAG config (mode on) or dynamic with LACP
- Traffic is load balanced across the two links using **src-dst-port** algorithm. CAPWAP uses random source UDP ports
- LAG must be connected to one single (physical or logical) switch

LACP = Link Aggregation Control Protocol
src-dst-port = source-destination-port

Power considerations

AP Power Consumption

Power Allocated

48.3 W

Power Consumed

16.5 W

PoE Power Negotiation happens at boot time through CDP/LLDP

Power allocation is what you need to consider for power budget

Actual Power consumption is dependent on the AP operation

Catalyst 9136 Power Consumption (dual port)

Both ports negotiate power and need to be considered for budget

If no-LAG, Standby port consumes very little power

If LAG, both ports are active, and they both draw power

Power Allocated

Power Consumed

Port 0

48.3 W

16.5 W

Port 1

48.3 W

0.5 W

Redundancy Options

RF Design

What you need to consider?

- **Path Loss (FSPL)*** - Path loss in the first meter is on average **2dB higher at 6GHz** vs. 5GHz. After that, the 6 dB rule applies: doubling the distance results in a 6 dB loss, regardless of the frequency
- **Cell Size** - At 6 GHz @ same power level cell is smaller vs. cell size at 5 GHz
- **Absorption/Reflectance** - 6 GHz will be attenuated more through wall or other surface
- **Noise floor** at 6 GHz is much lower than 5 GHz, at least for some time 😊
- **Coverage type**: Today 6GHz is indoor only

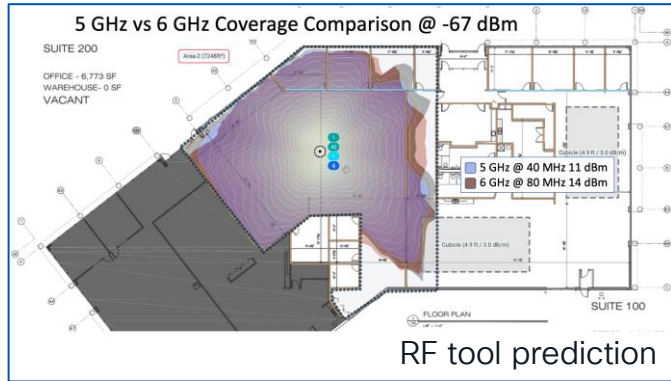

(*) FSPL = Free Space Path Loss: https://en.wikipedia.org/wiki/Free-space_path_loss

<https://help.keenetic.com/hc/en-us/articles/213968869-Wi-Fi-signal-attenuation-coefficients-when-passing-through-different-materials>

RF Design considerations

- AP antenna patterns at 6GHz are similar to 5GHz
- **AP coverage** between 5GHz and 6GHz will be similar, especially in open spaces BUT it does require to compensate with **power > 3dB higher in 6GHz**

- 5GHz @40 MHz 11dbm
- 6GHz @80 MHz 14 dbm

- With brick walls, elevator and other environments, you would probably need to measure and add few APs

Where are we then on 5 and 6 GHz assumptions?

Q1: Can a co-resident 6 GHz radio provide the same coverage as the 5 GHz cell while dramatically increasing performance?

A1: Yes!

Q2: Can a one for one replacement of Wi-Fi 6/5 APs with Wi-Fi 6E APs be achieved?

A2: Yes!

*Assuming 1.2 – 2k f² (140–190 m²) of average AP density, carpeted office normal ceiling (3 m /10 ft)

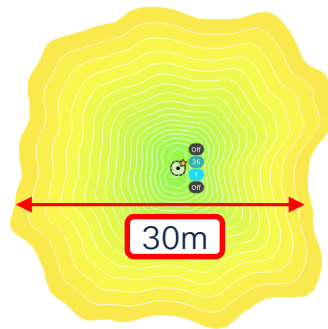

- 5 GHz network with RRM operating at power levels 3-4? >then equal 5 and 6 GHz coverage is possible with a one for one AP replacement in both ETSI and FCC. Assuming 80 MHz channel in FCC and 40 MHz channel in ETSI/UK
- If the power level is in 1-2, then you may need around 10 to 20% additional access points.

Wi-Fi 6E SP Indoors

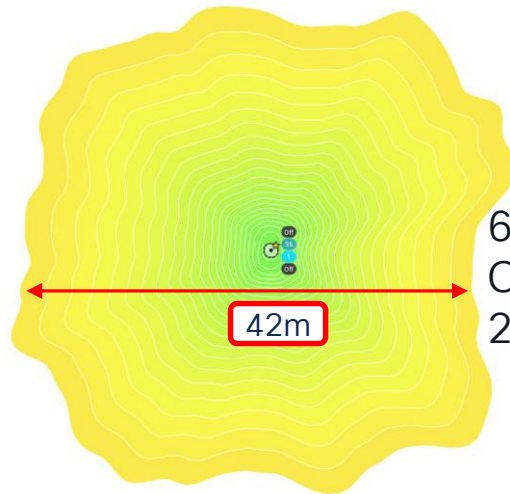

Higher Power In 20 MHz

- Allowing higher power in the first 20 MHz
 - **SP: Max - 36 dBm EIRP, LPI: 18 dBm EIRP**
 - Creates a larger cell size
 - Allows more power to reach the floor with a higher ceiling!
- High Ceiling Warehouse – larger Cells, less Clients – SP
- Atriums, high ceilings, loading docks, a lecture hall, Stairwells etc.
- Many installations have some or all of the above
- Wi-Fi 6E indoors – allows these use cases to be covered with 6 GHz too!

CW9166i @ 2.4m Height

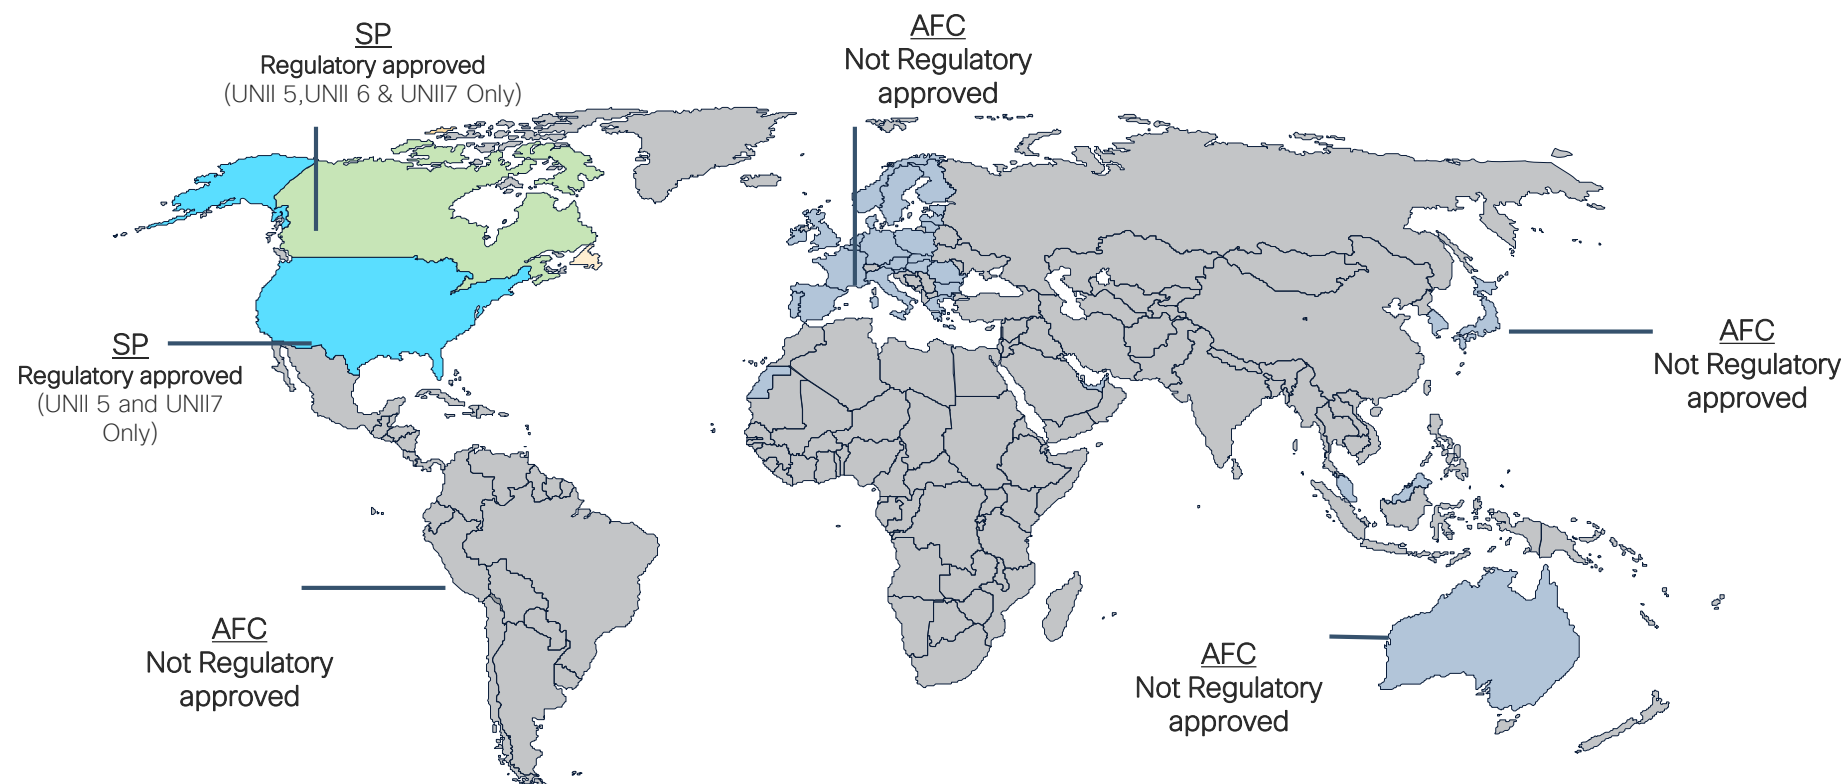

6 GHz
Ch 1@20-160 MHz
18 dBm EIRP LPI

6 GHz
Ch 1@20-160 MHz

Wi-Fi 6E – Security

Wi-Fi 6E Security

Wi-Fi 6E uplevels security.
WPA3 L2 Security: OWE,
SAE*, 802.1x-SHA256

WPA3 and Enhanced Open
Security made mandatory
for Wi-Fi 6E certification.

No backward compatibility
with Open and WPA2
Security.

Requires Protected
Management Frame (PMF)
in both AP and Clients.

*Only SAE-H2E (Hash to Element) Method Supported.
SAE (Hunting N Pecking) – Not Supported

AKM = Authentication and Key Management
OWE = Opportunistic Wireless Encryption
SAE = Simultaneous Authentication of Equals
SHA-256 = Secure Hash Algorithm (SHA) 256 bit

WLAN/SSID Design

6GHz WLAN Design Considerations

What options would you have?

1

"All-In" Option: Reconfigure the existing WLAN to WPA3, one SSID for all radio policies (2.4/5/6 GHz) – **Most unlikely**

2

"Multiple SSIDs" Option: Redesign your SSIDs, adding specific SSID/WLAN with specific security settings – **Most flexible**

3

"One SSID" Option: Configure multiple WLANs with same SSID name, different security settings – **Most conservative**

Most likely your current SSID configuration would prevent it from being broadcasted on 6GHz
Note: as 17.12.3, there is a limit of 8 SSIDs broadcasted on 6GHz radio

Option 1

Pros

- Cleanest and simplest option
- No new WLAN and SSID to be managed
- Most secure with WPA3 everywhere

Cons

- Breaks support for existing clients that don't support WPA3 and PMF in 2.4 and 5GHz
- Requires full control on client devices and drivers

Option 2

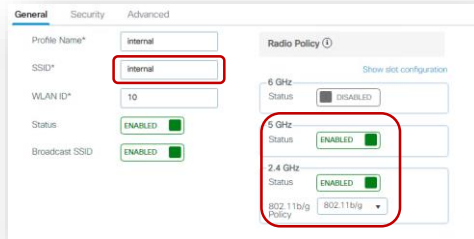

Option 2 – WLAN design considerations

- **Option 2:** Redesign the SSIDs. This entails adding a WPA3 separate SSID for 6GHz and then decide which bands to enable to address different customer use cases.
 - **Example 1:** customer wants to adopt 6GHz without touching the existing SSIDs > add a separate SSID with WPA3 and broadcast it in all bands.
 - **Example 2:** Customer wants to redesign the SSIDs dedicating each band for a specific device/use case

Option 2 > Example 1

Add a separate WLAN with different SSID name for WPA3 and broadcast it in all bands. Leave the existing WLAN/SSID untouched.

Dedicated SSID for WPA3 (new name) capable clients in all bands. This is the SSID for 6GHz

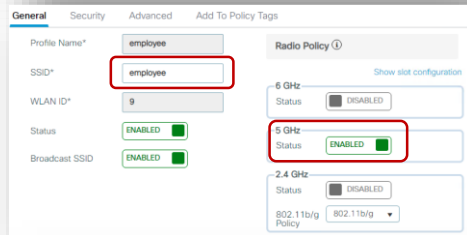

Option 2 > Example 2

Redesign the WLANs, reserving each band for a specific device/use case

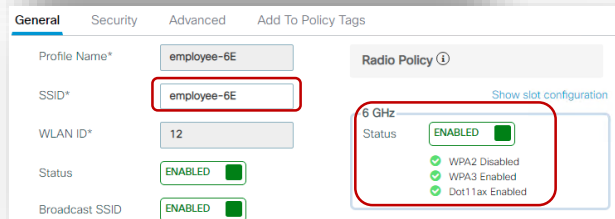

The screenshot shows the 'General' tab of a Cisco WLAN configuration page for a profile named 'IoT'. The 'SSID*' field is set to 'IoT-2.4GHz' and is highlighted with a red box. The 'WLAN ID*' is '8'. The 'Status' and 'Broadcast SSID' are both 'ENABLED'. In the 'Radio Policy' section, the '2.4 GHz' band is highlighted with a red box, showing its status as 'ENABLED' and the policy as '802.11b/g'.

2.4GHz dedicated to specific devices. These could be legacy devices or IoT devices. If IoT will be mostly PSK

The screenshot shows the 'General' tab of a Cisco WLAN configuration page for a profile named 'employee'. The 'SSID*' field is set to 'employee' and is highlighted with a red box. The 'WLAN ID*' is '9'. The 'Status' and 'Broadcast SSID' are both 'ENABLED'. In the 'Radio Policy' section, the '5 GHz' band is highlighted with a red box, showing its status as 'ENABLED'.

5GHz dedicated to majority of existing clients

The screenshot shows the 'General' tab of a Cisco WLAN configuration page for a profile named 'employee-6E'. The 'SSID*' field is set to 'employee-6E' and is highlighted with a red box. The 'WLAN ID*' is '12'. The 'Status' and 'Broadcast SSID' are both 'ENABLED'. In the 'Radio Policy' section, the '6 GHz' band is highlighted with a red box, showing its status as 'ENABLED' and a list of features: 'WPA2 Disabled', 'WPA3 Enabled', and 'Dot11ax Enabled'.

WPA3 on 6GHz band only, for the newest clients

Option 2

Pros

- Cleanest option from a client compatibility point of view
- Most secure options as clients can adopt WPA3 security
- WPA3 clients can roam across different bands
- Automated via Catalyst Center

Cons

- Additional SSIDs to configure & manage on WLC
- Need to manage additional SSID profiles on clients

Option 3

Option 3 - WLAN design considerations

Starting: IOS-XE 17.12.1

Single WLAN Profile for 2.4/5 and 6 GHz

WFA = Wi-Fi Alliance

Option 3

Pros

- Provide an adoption path to more secure Wi-Fi via WPA3 Transition mode
- Maintain support for older clients using WPA2.
- No new SSID profile to be managed on the client side

Cons

- Older clients may have issues connecting to an SSID with WPA3 Transition mode

Option 3- WLAN design considerations

Till: IOS-XE 17.11.1

Single SSID, Dual WLAN Profile for 2.4/5 and 6 GHz

- Single SSID but different AKM per band. For Cisco today, this means creating an additional WLAN for 6GHz, with same SSID name but different WLAN profile name and security settings (AKM):

Existing WLAN serving 2.4 and 5GHz

The screenshot shows the Cisco WLAN configuration interface for an existing WLAN. The 'General' tab is selected. The 'Profile Name*' is 'employee', 'SSID*' is 'employee', and 'WLAN ID*' is '9'. The 'Status' is 'ENABLED' and 'Broadcast SSID' is 'ENABLED'. The 'Radio Policy' section shows three bands: 6 GHz (Status: DISABLED), 5 GHz (Status: ENABLED), and 2.4 GHz (Status: ENABLED). The 802.11b/g Policy is set to '802.11b/g'.

New WLAN, same SSID name serving 6GHz

The screenshot shows the Cisco WLAN configuration interface for a new WLAN. The 'General' tab is selected. The 'Profile Name*' is 'employee-6GHz', 'SSID*' is 'employee', and 'WLAN ID*' is '10'. The 'Status' is 'ENABLED' and 'Broadcast SSID' is 'ENABLED'. The 'Radio Policy' section shows three bands: 6 GHz (Status: ENABLED), 5 GHz (Status: DISABLED), and 2.4 GHz (Status: DISABLED). The 802.11b/g Policy is set to '802.11b/g'. The 6 GHz band is highlighted with a red box, and the 5 GHz and 2.4 GHz bands are also highlighted with red boxes.

AKM = Authentication and Key Management

Option 3

Pros

- Maintain support for older clients using WPA/WPA2.
- No new SSID profile to be managed on the client side

Cons

- Clients may complain going from a WPA3 SSID to a lower security
- Roaming across different WLANs (same SSID) is not supported
- Not supported by Cisco Catalyst Center Automation

Wi-Fi 6E – Client Eco System

Wi-Fi 6E Device Support

Source: <https://wifinowglobal.com/news-blog/intel-ecosystem-tracking-2064-wi-fi-6e-devices-now-available-wi-fi-7-reaches-67-devices/>

Getting clients to join 6E – from bad to better

Bad: Early days of 6E

6E Capable clients *a/ways* preferred 5 GHz

Better: Now

More of 6E-capable clients join 6 GHz*

Working closely with client
device vendors

Recommendations:

1. Upgrade to the Latest Driver
2. Configure same network name across all bands

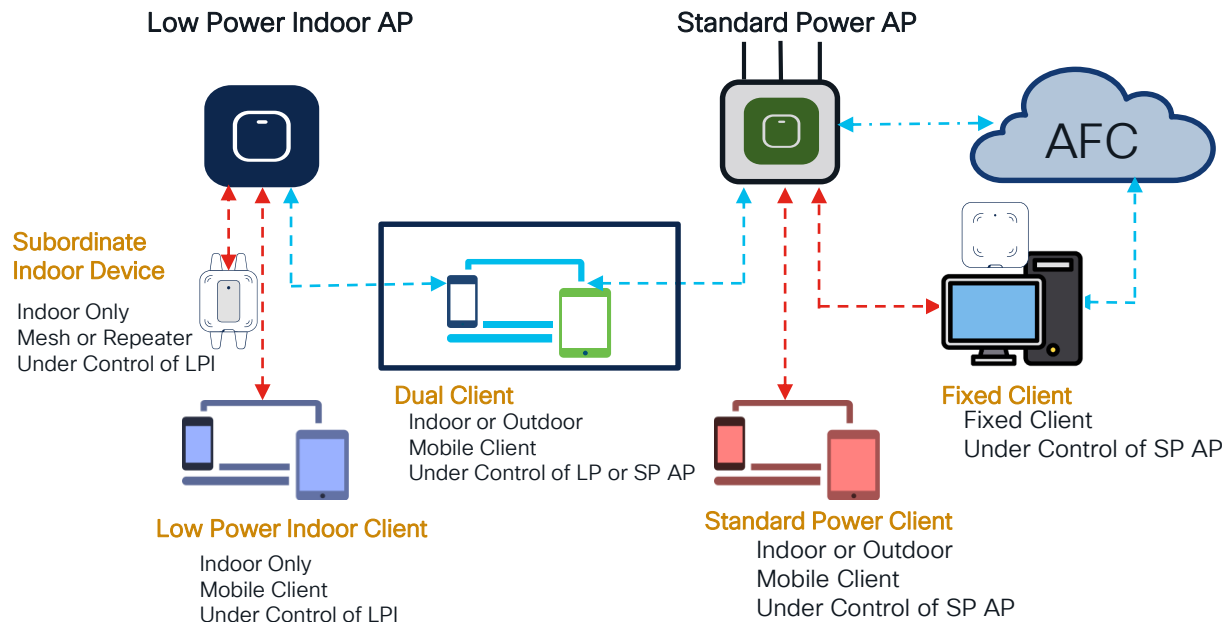

* Assuming latest driver

Readiness and benefits of 6 GHz from Cisco Catalyst Center 2.3.2

Readiness

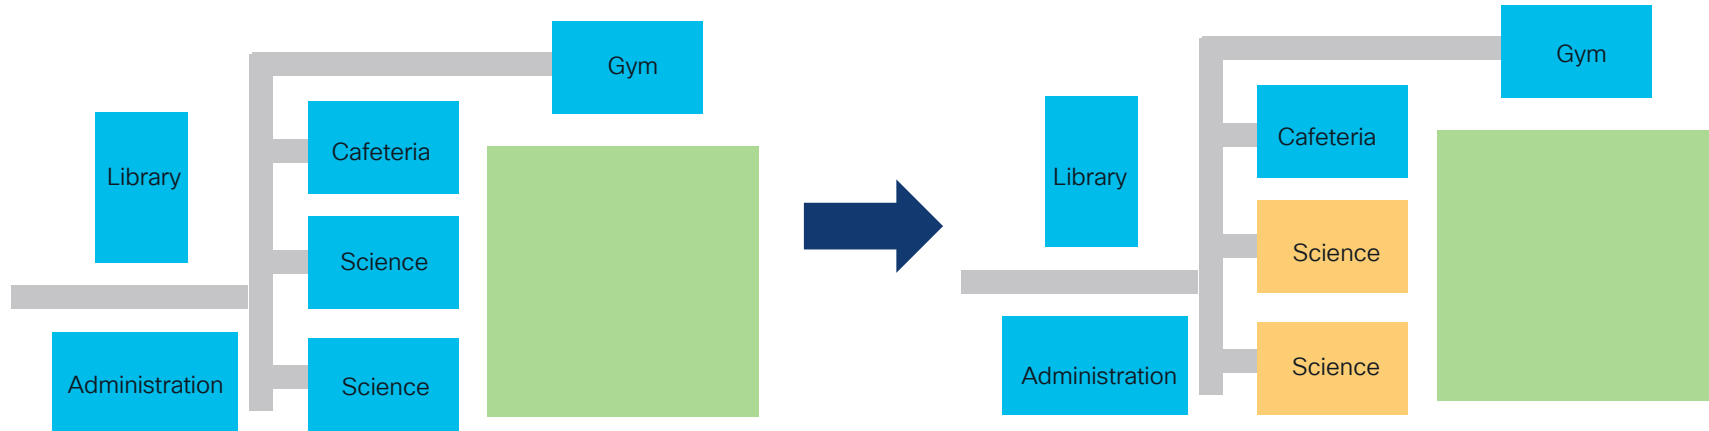

Benefits

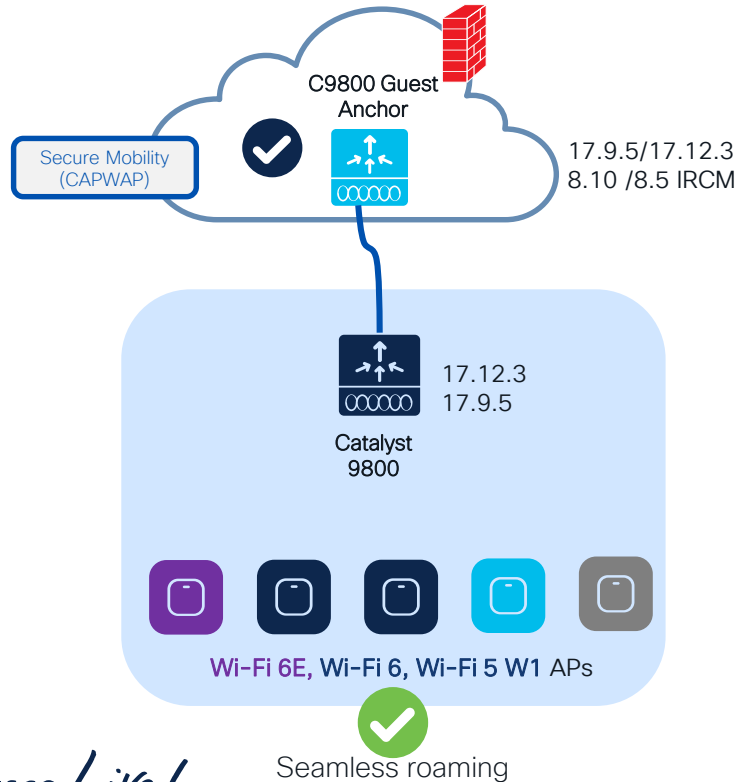

Migration Scenarios

- Move “per RF blocks”
- Move a building or complete floor into the new hardware and software

Avoid “Sale & Pepper” Deployments. Do not mix APs on different controllers at same time.

How do I start adopting 6GHz?

Scenario 1: If you have already started your C9800 journey

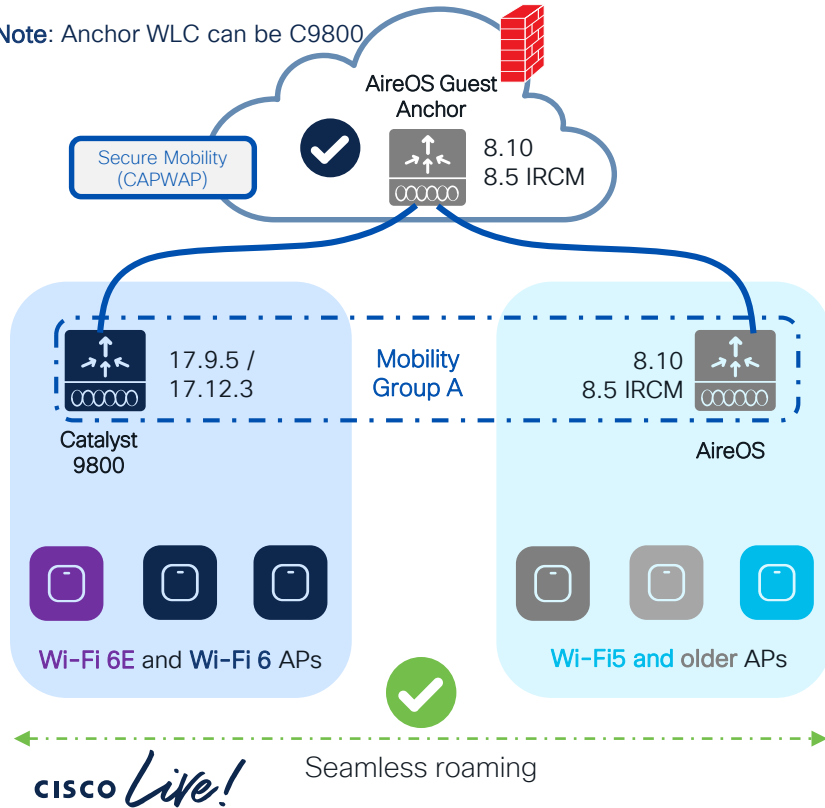

- Controller code is 17.12.3 or 17.9.5
- Wave 1 Aps support added (1700/2700/3700).
- **Note:** Anchor can be on AireOS as well (8.10 or 8.5 IRCM) latest
- **Note:** 17.12.1 for APJ Countries

(*) https://www.cisco.com/c/en/us/td/docs/wireless/controller/technotes/8-8/b_c9800_wireless_controller-aireos_ircm_dg.html

How do I start adopting 6GHz?

Answer: Inter Release Controller Mobility (IRCM)

Note: Anchor WLC can be C9800

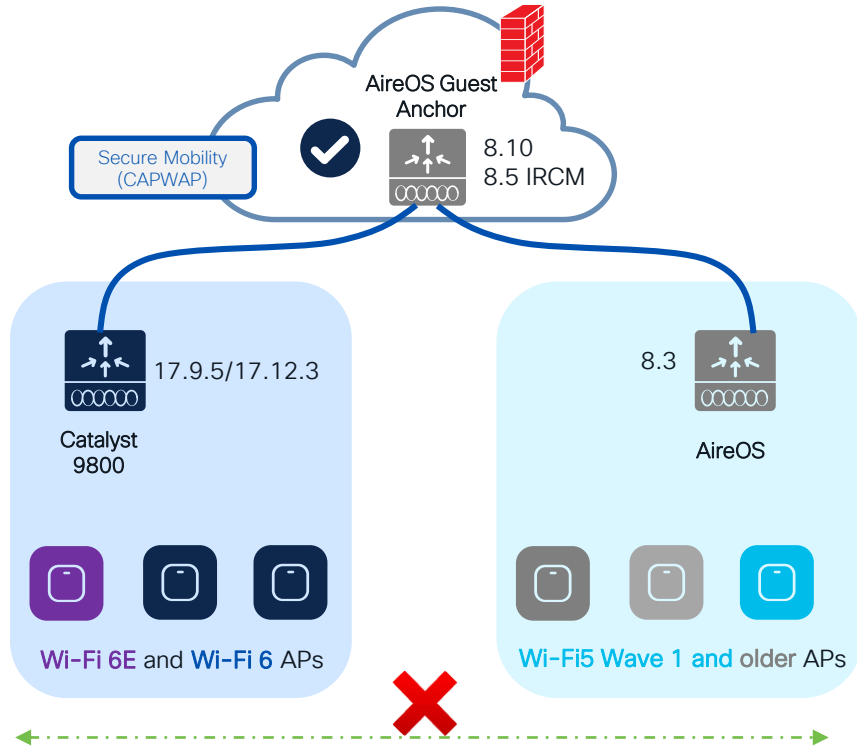

Scenario 1: Legacy Controller Supports IRCM

- Introduce new 6/6E AP hardware on the new C9800 and support seamless roaming and Guest Anchor with existing networks
- This method allows the smooth coexistence of both controllers, with RF areas migrated as needed, without any overnight switchover.
- Things to consider:
 - If the controller is limited to 8.5 (5508, 8510), we will need a special IRCM version (8.5.182.104), to connect them to IOS-XE
 - Best to split the RF network into different areas, configuring different RF group names between the legacy and IOS-XE controllers.
 - Always configure the primary/secondary controller name in access points. The new controllers will reject unsupported APs, but if any AP could work in both controller types, this will avoid APs joining the wrong one, or flip-flopping between them, until the migration is ready to proceed
- Fast & secure roam will only be supported if the WLAN profile is the same on the two WLCs

(*) https://www.cisco.com/c/en/us/td/docs/wireless/controller/technotes/8-8/b_c9800_wireless_controller-aires_ircm_dg.html

How do I start adopting 6GHz?

Answer: Inter Release Controller Mobility (IRCM)

No Seamless roaming

Scenario 2: Legacy Controller not supporting IRCM

- Not possible to establish IRCM between old controller and new 9800 handling 6E Aps
- Limits options available. Forces more aggressive migration process.
- Migration alternatives:
 - Keep the two networks separated ; migrate physical RF areas as new Aps are added.
 - Roaming is not possible.
 - Avoid migrations “per floor” as in most building types, it is normal to see clients roaming between Aps on different floor.
 - Temporarily, replace the legacy controller with one that supports IRCM.
- The release combinations shown have been tested at scale, check IRCM deployment guide*

Wi-Fi 7 & 802.11be in 1 slide

Wi-Fi 7 R1 spec finalized in Jan '24. WFA certification for R1 in progress. R2 expected Dec 2025. 802.11be is still not ratified (Exp Dec 2024)

In the enterprise, Wi-Fi 7 is a modest upgrade compared to Wi-Fi 6E. Enterprises can fully utilize the 6GHz spectrum with Wi-Fi 6E

Very few Wi-Fi 7 clients exist, and there is no Wi-Fi 7 support in Windows or MacOS

Cisco has been closely involved in development of Wi-Fi 7, and advocates for thorough client interop testing

6 GHz Wi-Fi with Wi-Fi 6E is mature

What is Wi-Fi 7 (and a bit of 11be)

320 MHz in 6 GHz

4K QAM

MLO

Enhanced Security

Compressed Block Ack
(512 MPDUs)

Multi-RU

Preamble puncturing

Mandatory in 6. Optional in 5

Communication Services

Industrial IoT

Hybrid Work

Immersive Gaming &
Entertainment

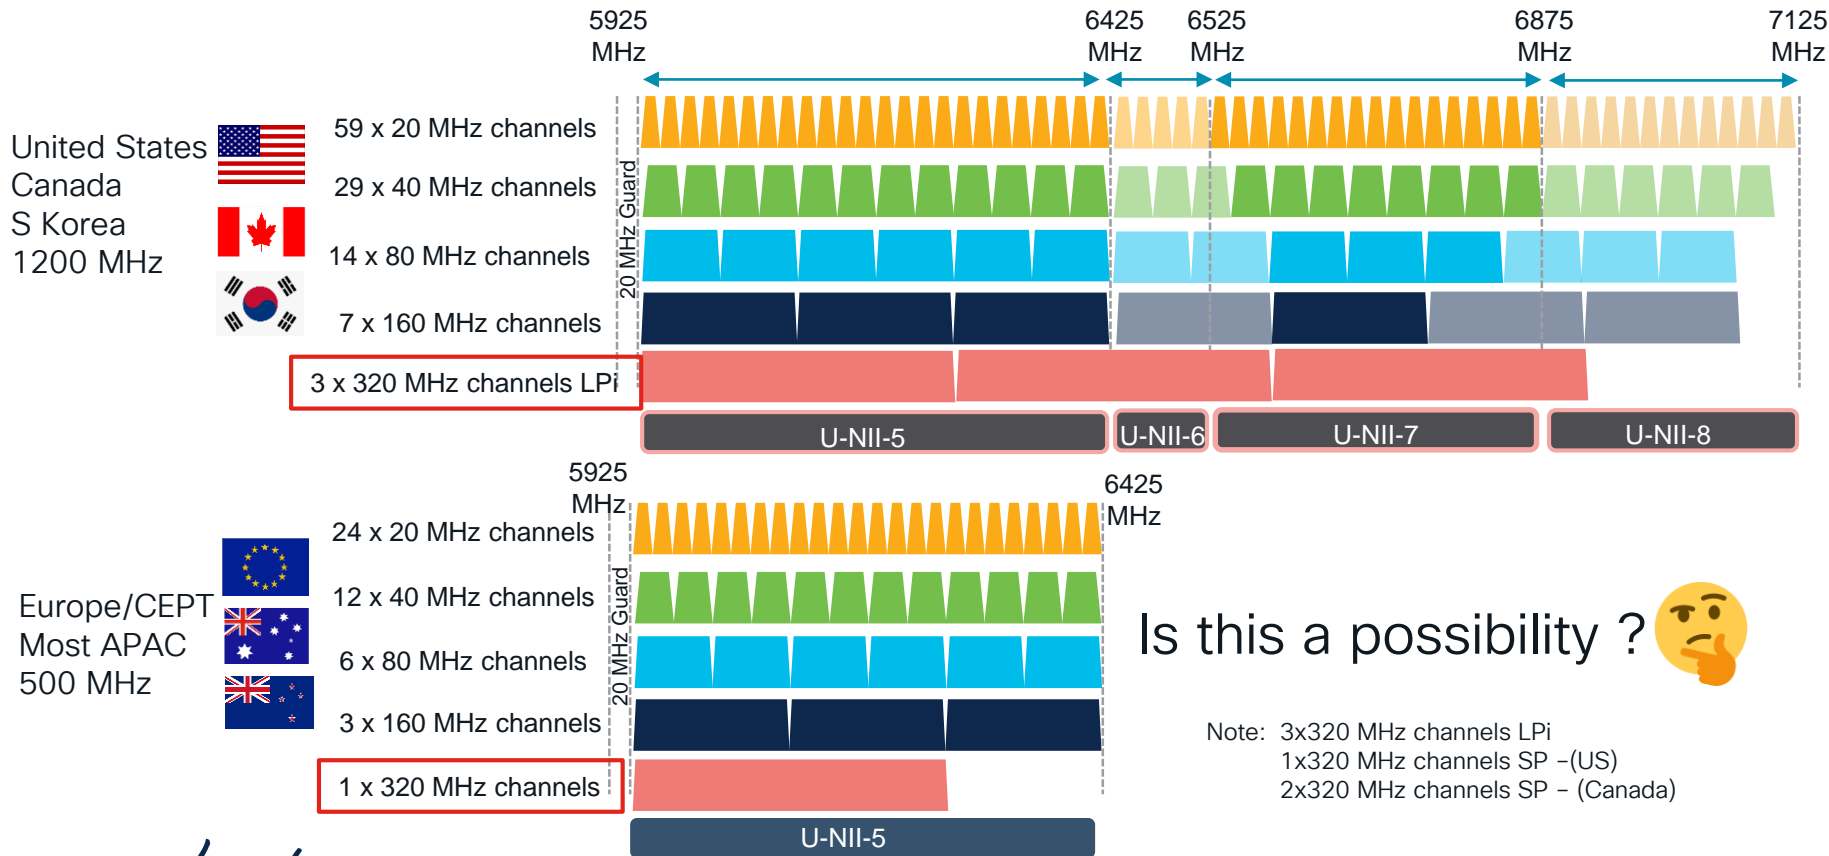

Automotive

Immersive Learning

Wi-Fi 7 – 320 MHz Channel Width

Is this a possibility ? 🤔

Note: 3x320 MHz channels LPI
 1x320 MHz channels SP – (US)
 2x320 MHz channels SP – (Canada)

Wi-Fi 7 4K-QAM (MCS12/13) increases the peak PHY data rate

- MCS 12 and MCS 13 indicate a 4096-QAM constellation with a code rate of $\frac{3}{4}$ and $\frac{5}{6}$ respectively
- Very short range and most suited to a 1 antenna client with a multi-antenna AP (beamforming, MRC)

Need very high SNR for 4K QAM

Each increment in constellation size reduces range by approx. 50%

Incremental data rate

Wi-Fi 7 – Multilink (MLO)

| Method | Benefit |
|-------------|---------------|
| Aggregation | Throughput |
| Steering | Lower Latency |
| Redundancy | Reliability |

MLD: Multi Link Device

Wi-Fi 7 MLD MAC Layers

MLD Upper MAC Layer functions :

- Auth, (Re)Association
- Security association
- SN assignment for unicast & groupcast frames
- Encryption/Decryption of unicast frames
- Power save buffering of unicast frames
- MLD level management frames
- Unified Block Ack scoreboard
- Packet re-ordering, replay detection
- Selection of MLD lower MAC for Tx

Non-MLD Upper MAC Layer functions:

- Non-MLO peer operation (above MLD lower MAC)
- Link specific group keys
- Link specific encryption/decryption of groupcast
- Power save buffering of groupcast frames

MLD Lower MAC Layer functions:

- Link specific mgmt. frames (beacons)
- Control Frames (RTS, CTS, Ack,...)
- Power save state and mode
- Per-link Block Ack scoreboard

The many “modes” of MLO

...because clients have different hardware capabilities

Single Radio

MLSR

Only one link operational at a given time

EMLSR

MLSR plus additional capability to listen to two links.

Acronyms:

MLMR – Multi-link Multi Radio

MLSR – Multi-link Single Radio

EMLSR – Enhanced Multi-link Single Radio

Multi Radio

MLMR
Simultaneous TX + RX
(STR)

Each link operating independently for Tx and Rx

MLMR
Non-Simultaneous Tx+Rx
(nSTR)

Tx or Rx at the same time on different links
(Not included in Wi-Fi 7 Certification)

Wi-Fi 7 MLO Modes

| MLO Modes | Number of Radios | Characteristics |
|--|------------------|--|
| Multi-Link Single Radio (MLSR) | 1 | Tx/Rx over one link at a time |
| Enhanced Multi-Link Single Radio (EMLSR) | 1 | MLSR with additional capability to listen on multiple links simultaneously in low capability mode |
| Simultaneous Tx and Rx (STR)* | ≥ 2 | Simultaneous Tx/Tx, Rx/Rx or Tx/Rx on a pair of STR links independent of each other |
| Non-Simultaneous Tx and Rx (NSTR)* | ≥ 2 | Simultaneous Tx/Tx or Rx/Rx over a pair of links with careful alignment of PPDU's end time |
| Enhanced Multi Link Multi Radio (EMLMR)* | ≥ 2 | MLMR (STR) with additional capability to dynamically reconfigure spatial multiplexing support on each link |

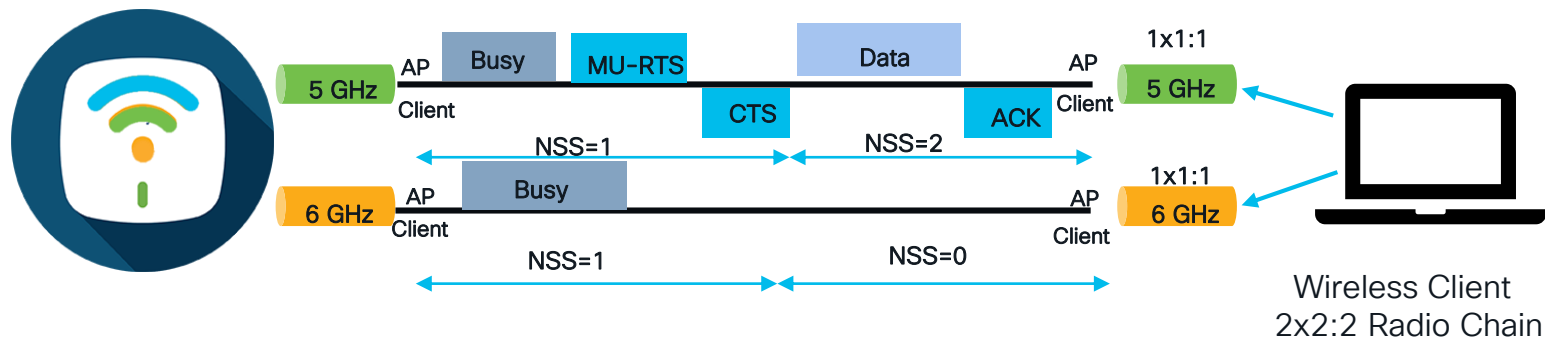

Requirement:

- MLSR is supported by all MLO devices.
- An AP MLD is required to support both EMLSR and STR .
- A non-AP MLD with 2SS and 160 MHz channel width on at least one link is required to support either EMLSR or STR.

* The last three modes are MLMR (Multi-Link Multi-Radio) operation modes. Only STR is part of Wi-Fi 7 R1. NSTR and EMLMR modes have significant implementation complexity and are not adopted in Wi-Fi 7.

Wi-Fi 7 – EMLSR Operation

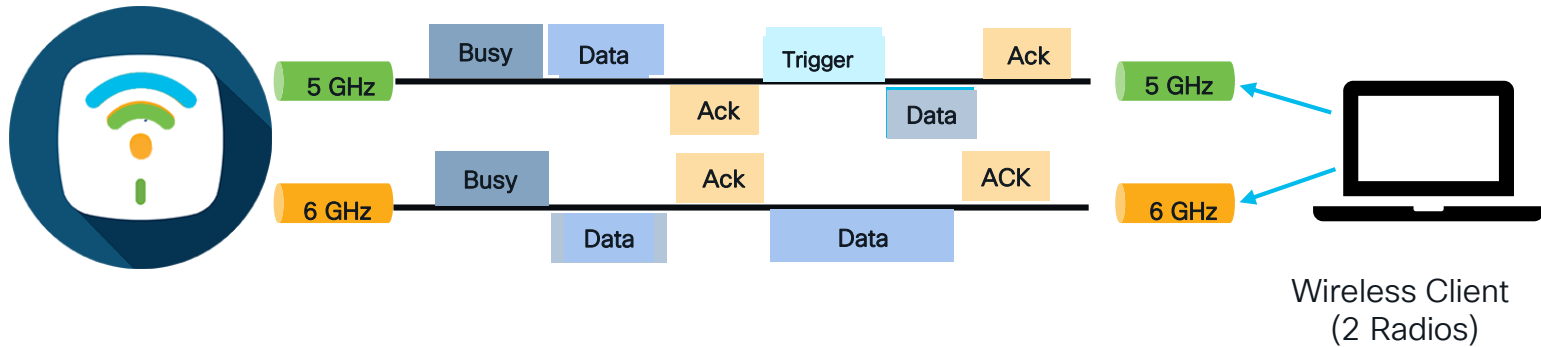

Downlink Transmission from AP to EMLSR Wireless Client

- Single Radio Wireless Clients with 2x2:2 Radio listens to two channels
Example: 1x1:1 on 5 GHz and 1x1:1 on 6 GHz
- Switches to 2x2:2 during active data transmission on the channel with TXOP
- After TxOP, goes back to listening mode with 1x1:1 on each channel.

Wi-Fi 7 – MLMR – STR Operation

Downlink Transmission from AP to MLMR-STR Wireless Client

- Each link can transmit or receive independently
- Maximum throughput and performance

On Multilink Operation (MLO)

- Client (STA) connected on multiple bands to the **same** AP, **not** to multiple APs (that is Wi-Fi 8)
- MLO is most likely going to be 2 band on clients – not 3 band
- Single radio client – EMLSR on two links.
- Band-isolation on clients between 5 and 6 determines MLO capabilities; so some clients might “only” do 2.4 + 5, or 2.4 + 6 in MLMR-STR
- Devil is in the detail: Single radio (SR) vs Multi radio (MR). STR vs EMLSR
- Same AKM across all links in an MLO Group (!).

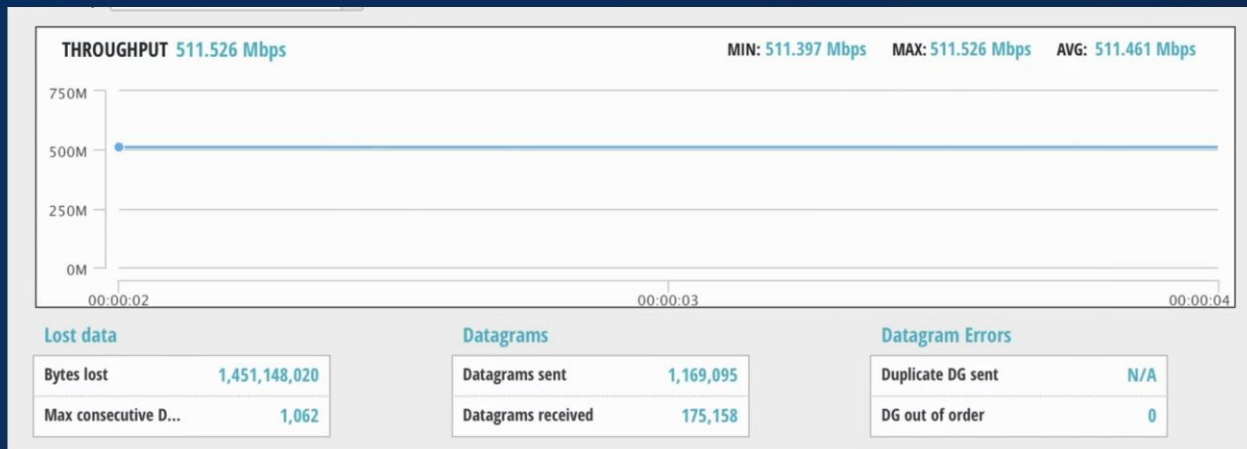

MLO

Downlink Throughput Test

MLO: 5+6GHz/40MHz
Average Throughput: 980Mbps

SLO: 5GHz/40MHz
Average Throughput: 510Mbps

Wi-Fi 7 Preamble Puncturing

Without Preamble Puncturing:

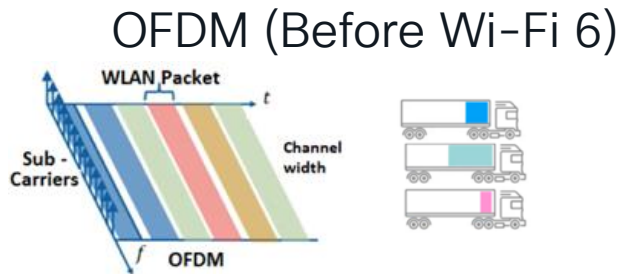

With Preamble Puncturing:

Puncturing allowed for
80 MHz channel width or wider

| Channel Width | Allowed Puncturing |
|---------------|----------------------------------|
| 80 MHz | 20 MHz |
| 160 MHz | 20 or 40 MHz |
| 320 MHz | 40 or 80 MHz (or) 40 + 80 MHz |

Wi-Fi 7 Multiple Resource Unit (MRU)

OFDMA (Wi-Fi 6 and later)

← One user can have only one RU

← One user can have multiple RUs

Resource Unit (RU) is a unit to denote a group of subcarriers (tones) in OFDMA

Multiple RUs make efficient use of spectrum

16 Spatial Streams

- Won't be supported in Wi-Fi 7
- Will stay at max 8 spatial streams
- Public docs refer to 16 spatial streams

Wi-Fi 7 Security

Wi-Fi 7 brings new AKM support for WPA3-SAE and new increased ciphers for OWE & SAE
WPA3 /OWE mandatory for EHT (11be MCS rates) & MLO

| Older | Wi-Fi 6E (6 GHz) | Wi-Fi 7 |
|--|--|--|
| Open | OWE (AKM: 18) (Cipher: CCMP 128) | OWE (AKM: 18) (Cipher: CCMP 128 or GCMP 256) |
| WPA2/WPA3 Transition/ WPA3-SAE(Personal), PMF Optional (WPA 2 - AKM - 2, 4 & 6) (WPA 3 - AKM - 8 & 9) (Cipher: CCMP 128 or AES) | WPA3-SAE (Personal), PMF Mandatory (AKM: 8 & 9) (Cipher: CCMP 128 or AES) | WPA3-SAE (Personal), PMF Mandatory (AKM: 24 & 25) (Cipher: CCMP128 or GCMP 256) |
| WPA/WPA3 Transition/ WPA3-SAE Enterprise, PMF Optional (AKM 1, 3 & 5, 11 & 12) (Cipher: AES, CCMP 128, GCMP128 GCMP256) | WPA3 Enterprise, PMF Mandatory (AKM: 3, 5, 11 & 12) (Cipher: GCMP 128 & GCMP 256) | WPA3 Enterprise, PMF Mandatory (AKM: 3, 5, 11 & 12) (Cipher: GCMP 128 & GCMP 256) |

Cipher: GCMP 256 - Better Encryption & Speed; AKM: Better security

Wi-Fi 7 Certified Client List

Wi-Fi 7 for enterprise ...

6 GHz Wi-Fi (with 6E)

CISCO *Live!*

Consumer Wi-Fi 7

Image credit" <https://www.business-to-you.com/crossing-the-chasm-technology-adoption-life-cycle/>

7 Key takeaways:

1. Wi-Fi in 6 GHz is the paradigm shift.
2. Cisco has a full portfolio of products to help customers realize 6 GHz Wi-Fi today.
3. Wi-Fi 7 certification just got available; understand what features are certified.
4. Short to mid-term, Wi-Fi 7 brings only slight benefits in the enterprise vs 6E.
5. Plan for security upgrade. Client interop will be key!
6. Plan for more than 30W per port, and plan for more than 1 Gbps per port.
7. Isn't quite ready for enterprise yet ...

Complete Your Session Evaluations

Complete a minimum of 4 session surveys and the Overall Event Survey to be entered in a drawing to **win 1 of 5 full conference passes** to Cisco Live 2025.

Earn 100 points per survey completed and compete on the Cisco Live Challenge leaderboard.

Level up and earn **exclusive prizes!**

Complete your surveys in the **Cisco Live mobile app**.

Continue your education

- Visit the Cisco Showcase for related demos
- Book your one-on-one Meet the Engineer meeting
- Attend the interactive education with DevNet, Capture the Flag, and Walk-in Labs
- Visit the On-Demand Library for more sessions at www.CiscoLive.com/on-demand

The bridge to possible

Thank you
