

# Understanding, Identifying and Resolving Congestion in a UCS Converged Infrastructure

**cisco** Live !

De-blackboxifying congestion in the UCS

Edward Mazurek  
Principal Engineer CX, @TheRealEdMaz

# Cisco Webex App

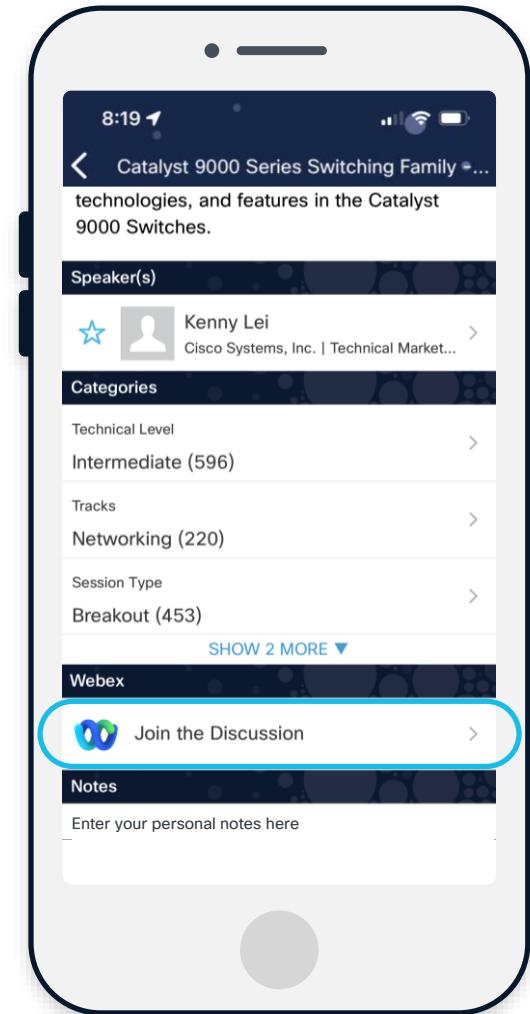

## Questions?

Use Cisco Webex App to chat with the speaker after the session

## How

- 1 Find this session in the Cisco Live Mobile App
- 2 Click “Join the Discussion”
- 3 Install the Webex App or go directly to the Webex space
- 4 Enter messages/questions in the Webex space

**Webex spaces will be moderated by the speaker until June 13, 2025.**

# Agenda

- 01 The UCS Congestion Problem
- 02 UCS Domain Logical Network Layout
- 03 Flow Control Mechanisms
- 04 TxWait and RxWait
- 05 Congestion Types
- 06 UCS Congestion Points
- 07 Troubleshooting Workflows
- 08 UCS Congestion Commands
- 09 UCS Techsupport Commands
- 10 Conclusion

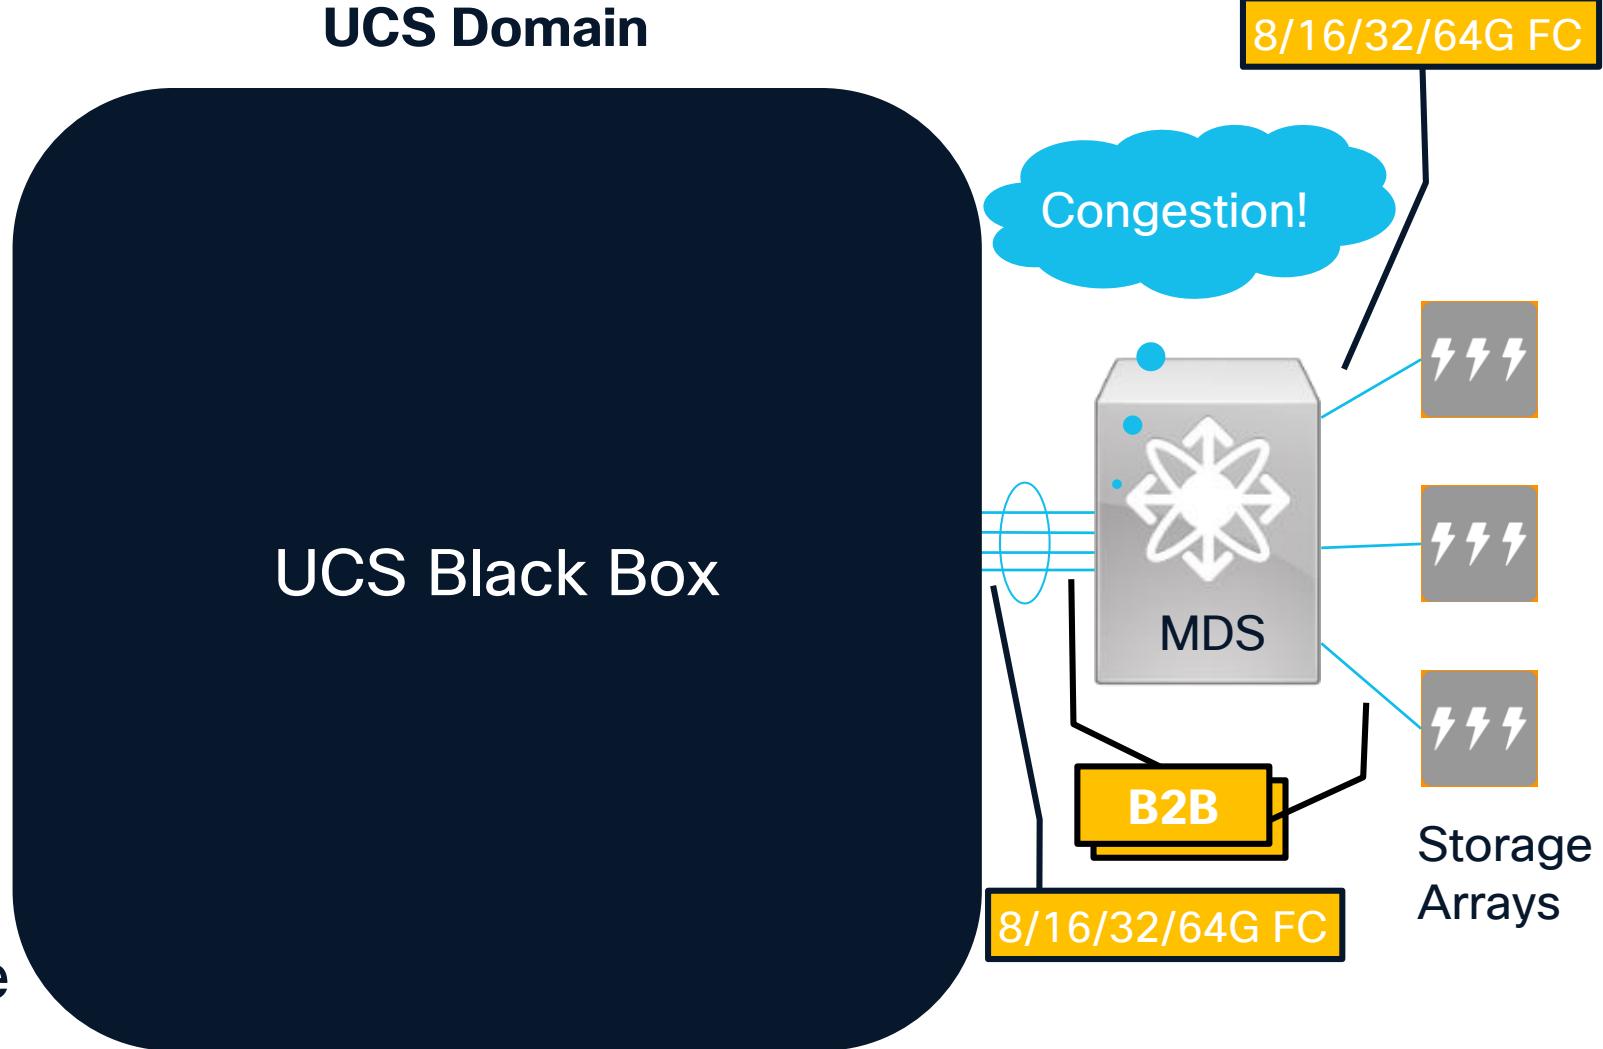

# The UCS Congestion Problem

# UCS Congestion Problem

## Problem Types

- SAN administrators report congestion on links to UCS
- Applications on servers report slow performance
- Storage arrays report slow performance/congestion or errors

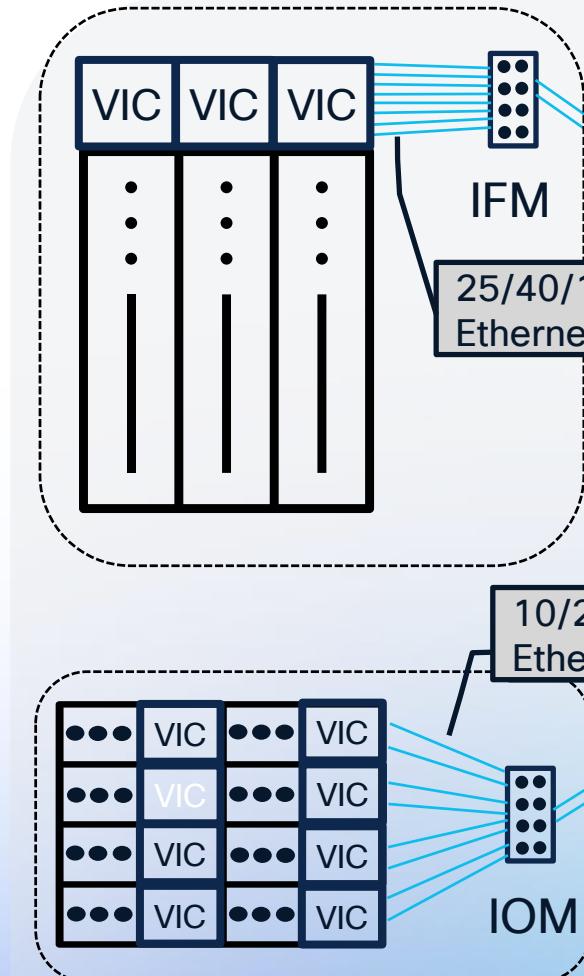

How can the UCS “Black Box” be investigated to determine the reason for the congestion?

# UCS Domain Logical Network Layout

# Ethernet Priority Flow Control - PFC

Just the facts

- PFC makes Ethernet into a lossless network protocol a.k.a “converged Ethernet”
- Priority Flow Control defined in IEEE 802.1Qbb
- Used by FCoE and RoCE
- Receiver can pause the FCoE/RoCE classes when congested
- Two types of Pauses
  - **Pause** (non-zero quanta) – Receiver must immediately stop sending **or continue not sending**
  - **UnPause** (zero quanta) – Receiver can immediately resume sending

# Priority Flow Control - PFC

Just the Facts continued... PFC Quanta

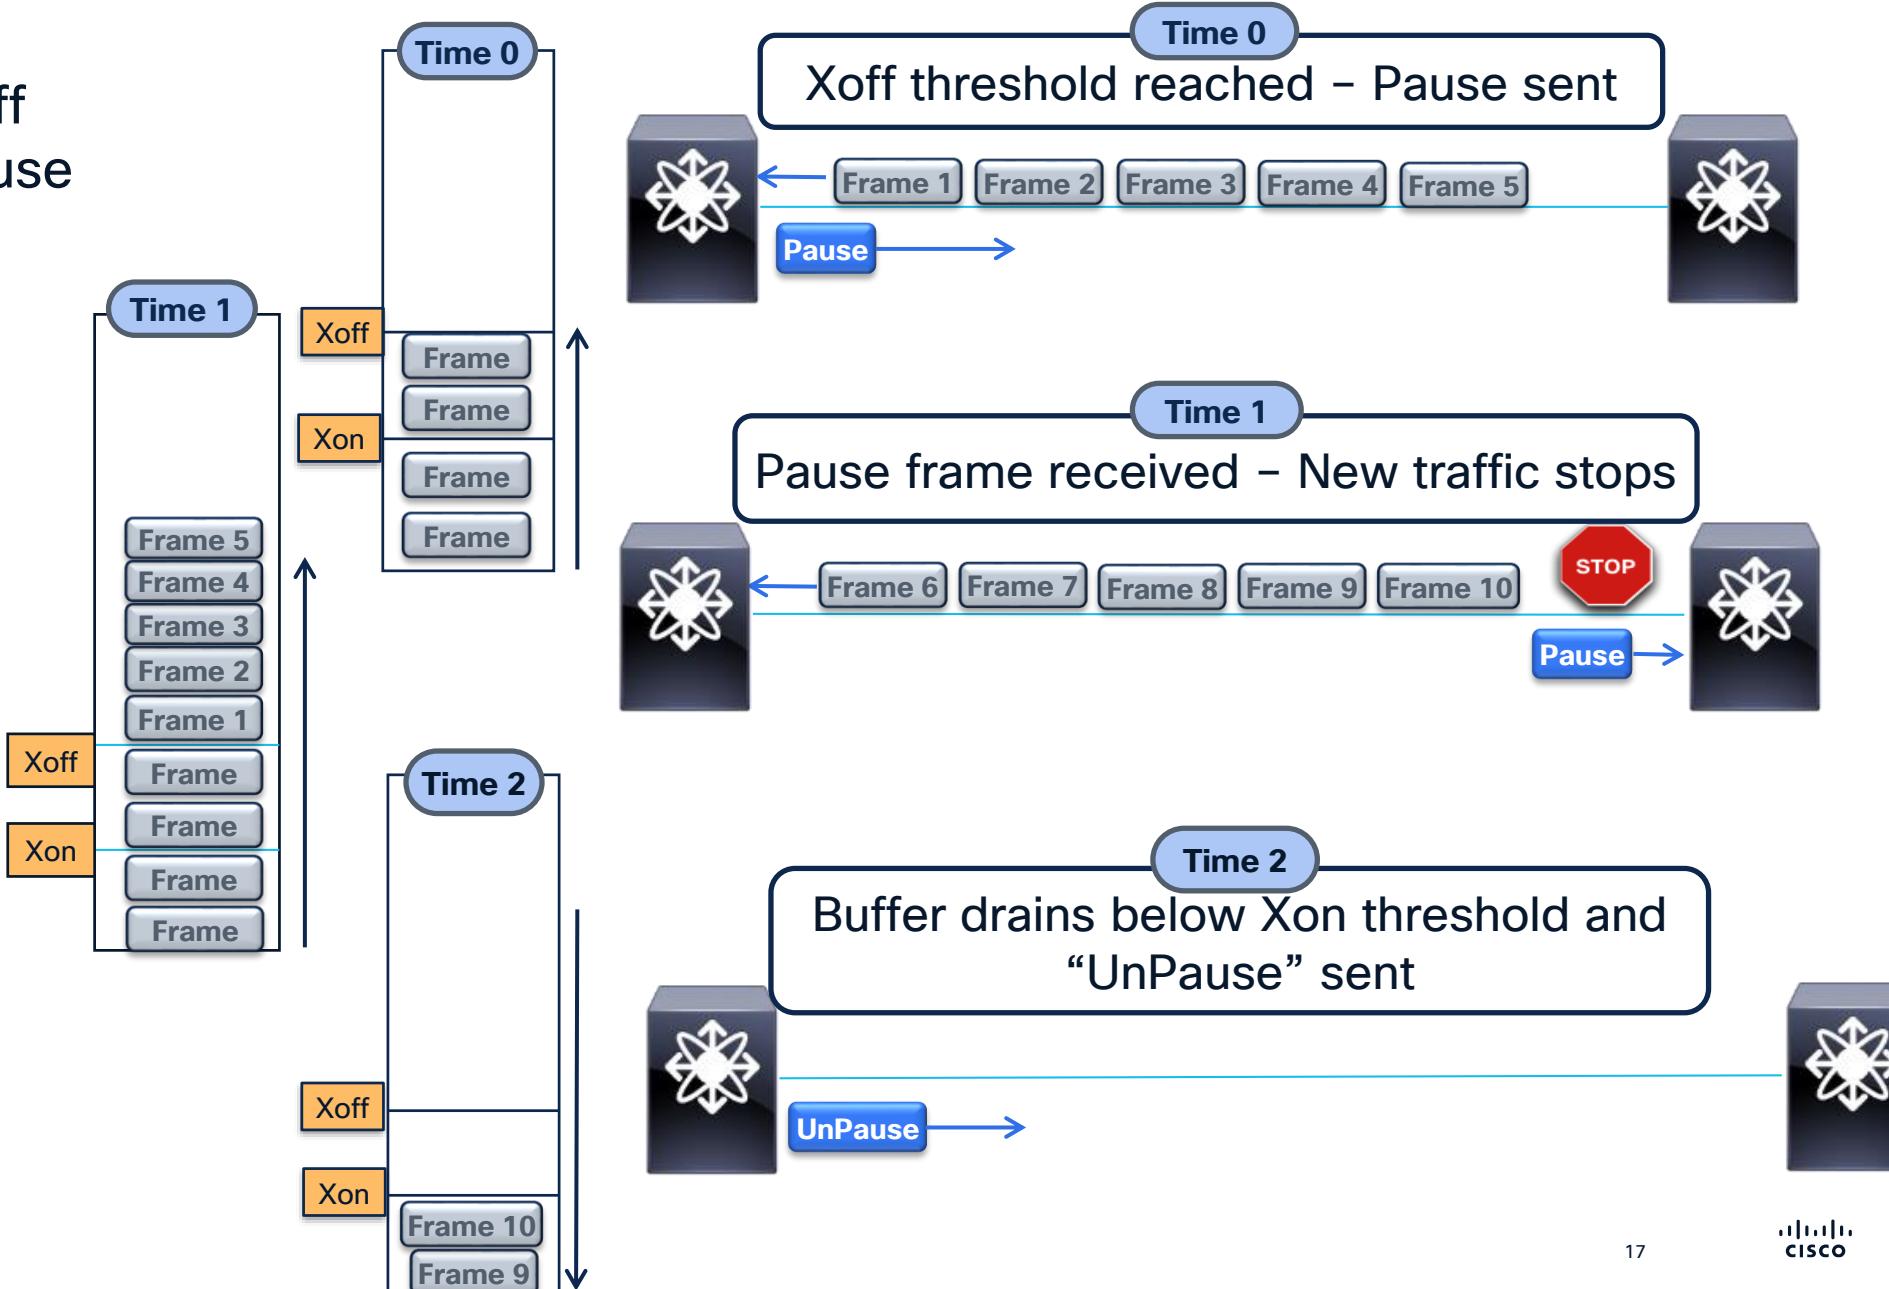

- Frames are transmitted unless Pause w/non-zero **quanta** has been received
- Amount of time class is paused is measured in **quanta**
- Each **quanta** is the amount of time taken to send 512 bits at link speed
- **Quanta** is contained in a two-byte field – Maximum value is 0xFFFF (65535)
- As speed increases the time represented by the **quanta** decreases
  - 0xFFFF at 10G 3.3ms
  - 0xFFFF at 100G 0.33ms
- Most Pauses do not ‘expire’ (pause traffic for the quanta duration)
  - Most Pauses are followed quickly by UnPauses
- The time the class is paused is the duration between Pause and UnPause
- Very important to understand which side of the link is reporting Tx/Rx Pauses!

# PFC Flow Control Thresholds

PFC Buffer Xon and Xoff thresholds and PFC Pause

Pauses are sent based on Xoff and Xon thresholds being reached

Pauses are not necessarily sent because pauses have been received from other interfaces

# Priority Flow Control

# Anatomy of a PFC Pause frame

- [-] **Data Link Control (DLC)**

## Opcode 0101 PFC Pause

## Class 3 enabled

Class 3 “unpaused”  
since quanta is zero

When the priority enable bit is on for a class and the quanta is 0 the pause frame cancels a previous pause and allows for immediate resumption of transmission by the receiver

Quanta is 0x0000 = 0ms

# Priority Flow Control

Pause and UnPause timing Example

Icon	Bookmark	us.ns	Delta	Port	Side A	Side B	Protocol	Summary

This example shows Pauses that are continued multiple times

UnPause 19ms later!

# Enhanced Transmission Selection – ETS

Just the facts

- Guarantees each class a minimum percentage of the link
- Enhanced Transmission Selection defined in IEEE 802.1Qbb
- When there is available link bandwidth classes can transmit at higher rates
- Defined in egress queuing policy-map
- Congestion may appear only in the presence of other traffic!

# Fibre Channel Buffer to Buffer Flow Control

## Just the Facts

- Fibre Channel is a ‘lossless’ network protocol by design
- Sender does not send a frame unless the receiver has a buffer
- Fibre Channel utilizes Buffer-to-Buffer(B2B) Credit based flow control
- Each side of link informs adjacent side of the number of buffers/credits
- Each frame sent requires a B2B credit to be returned
- B2B credits are also called ‘R\_RDYs’
- **Frame receivers can slow rate of ingress traffic by ‘withholding’ credits**
- **If a sender runs out of credits it must stop sending until it receives one**

# TxWait and RxWait

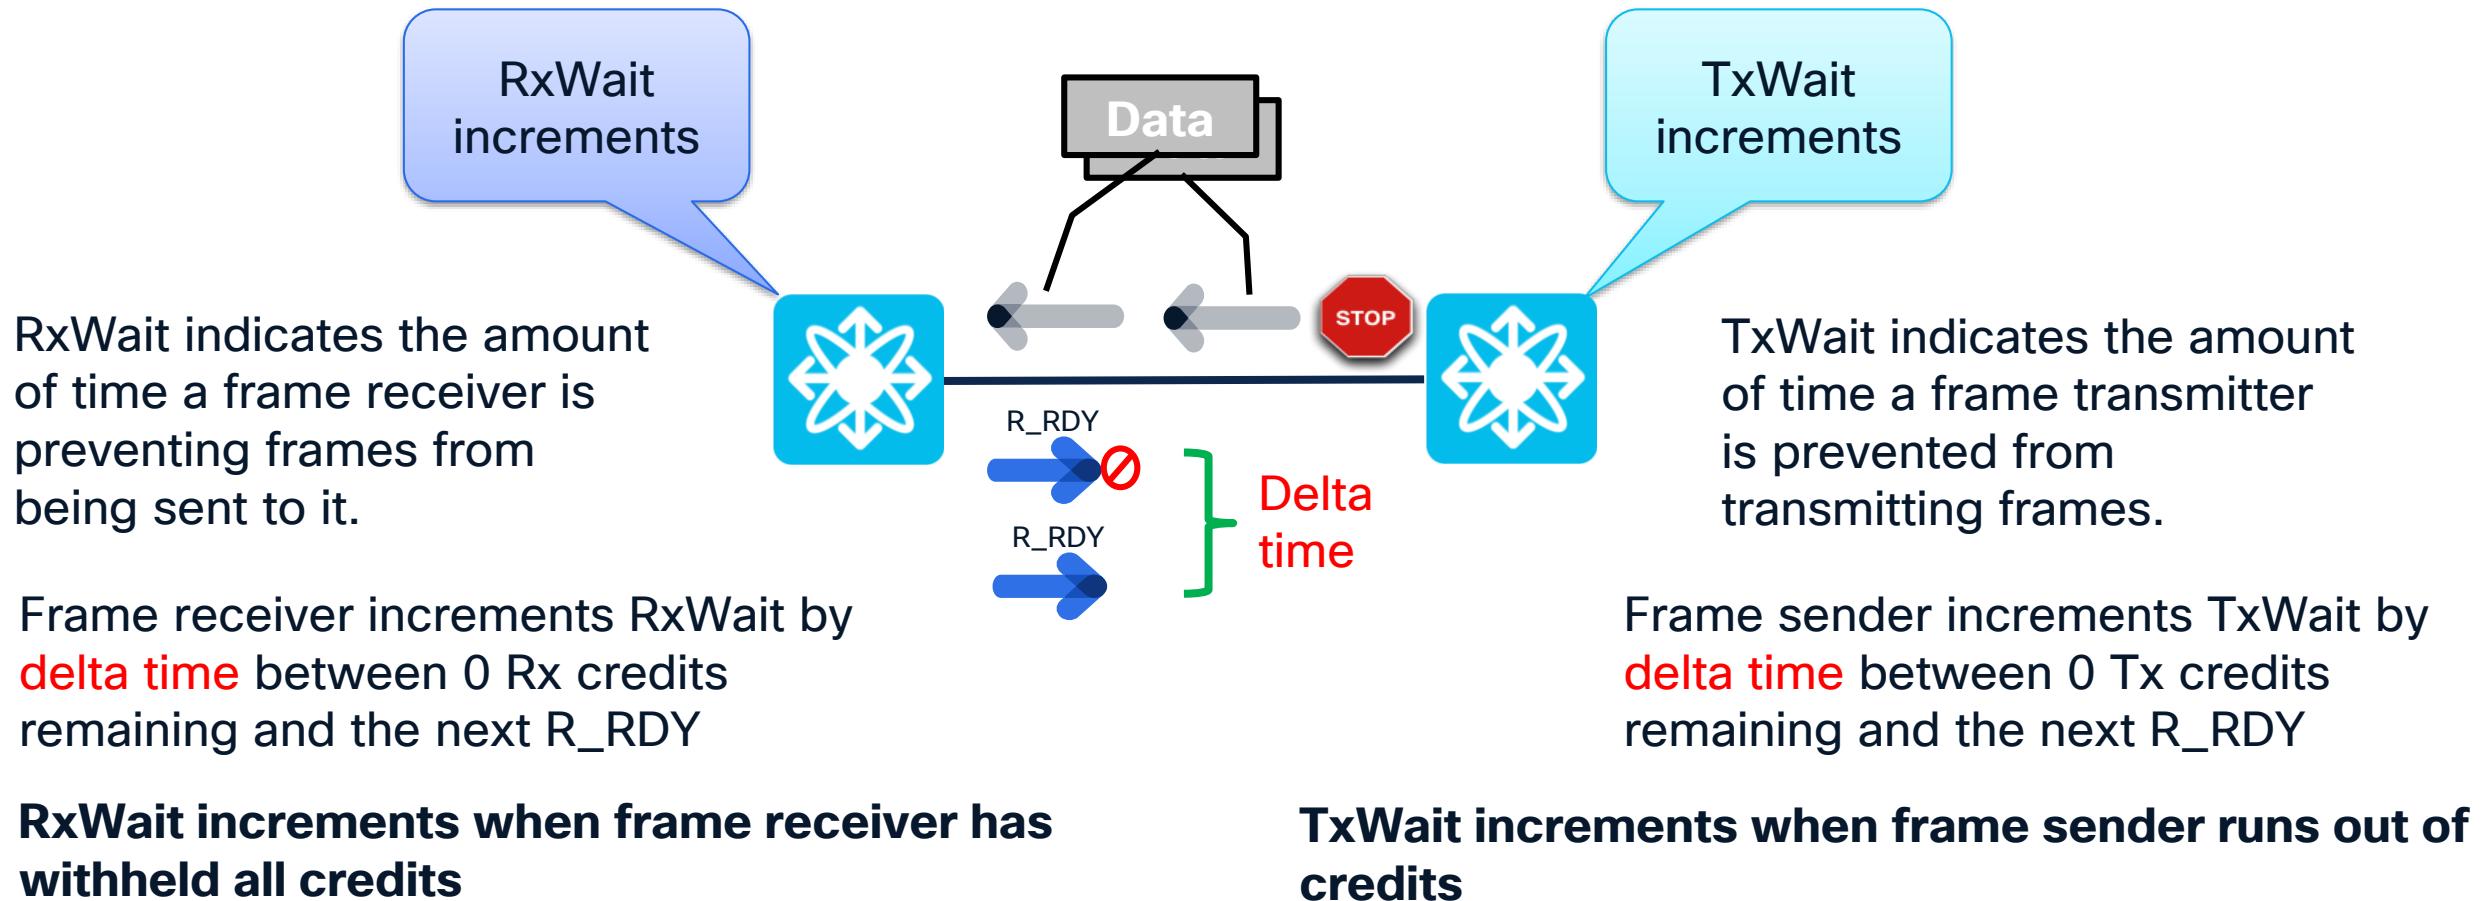

# TxWait and RxWait

- **TxWait and RxWait exist in both Fibre Channel and PFC Ethernet**
- **Both are measures of time in  $2.5\mu\text{s}$  increments (2.5 microseconds)**
- **Increment separately by class**
- **TxWait increments when frame sender cannot transmit**
  - In FC frame sender has zero Tx credits
  - In Ethernet frame sender has received PFC Pause
- **RxWait increments when frame receiver has prevented reception of frames**
  - In FC frame receiver has withheld all credits (zero Rx credits)
  - In Ethernet frame receiver has transmitted PFC Pause
- Not all Ethernet ASICs support TxWait and RxWait

# TxWait and RxWait in Ethernet PFC

# TxWait and RxWait in Fibre Channel

# Congestion Types

# Slow Drain and Over-Utilization

Two main types or causes of congestion

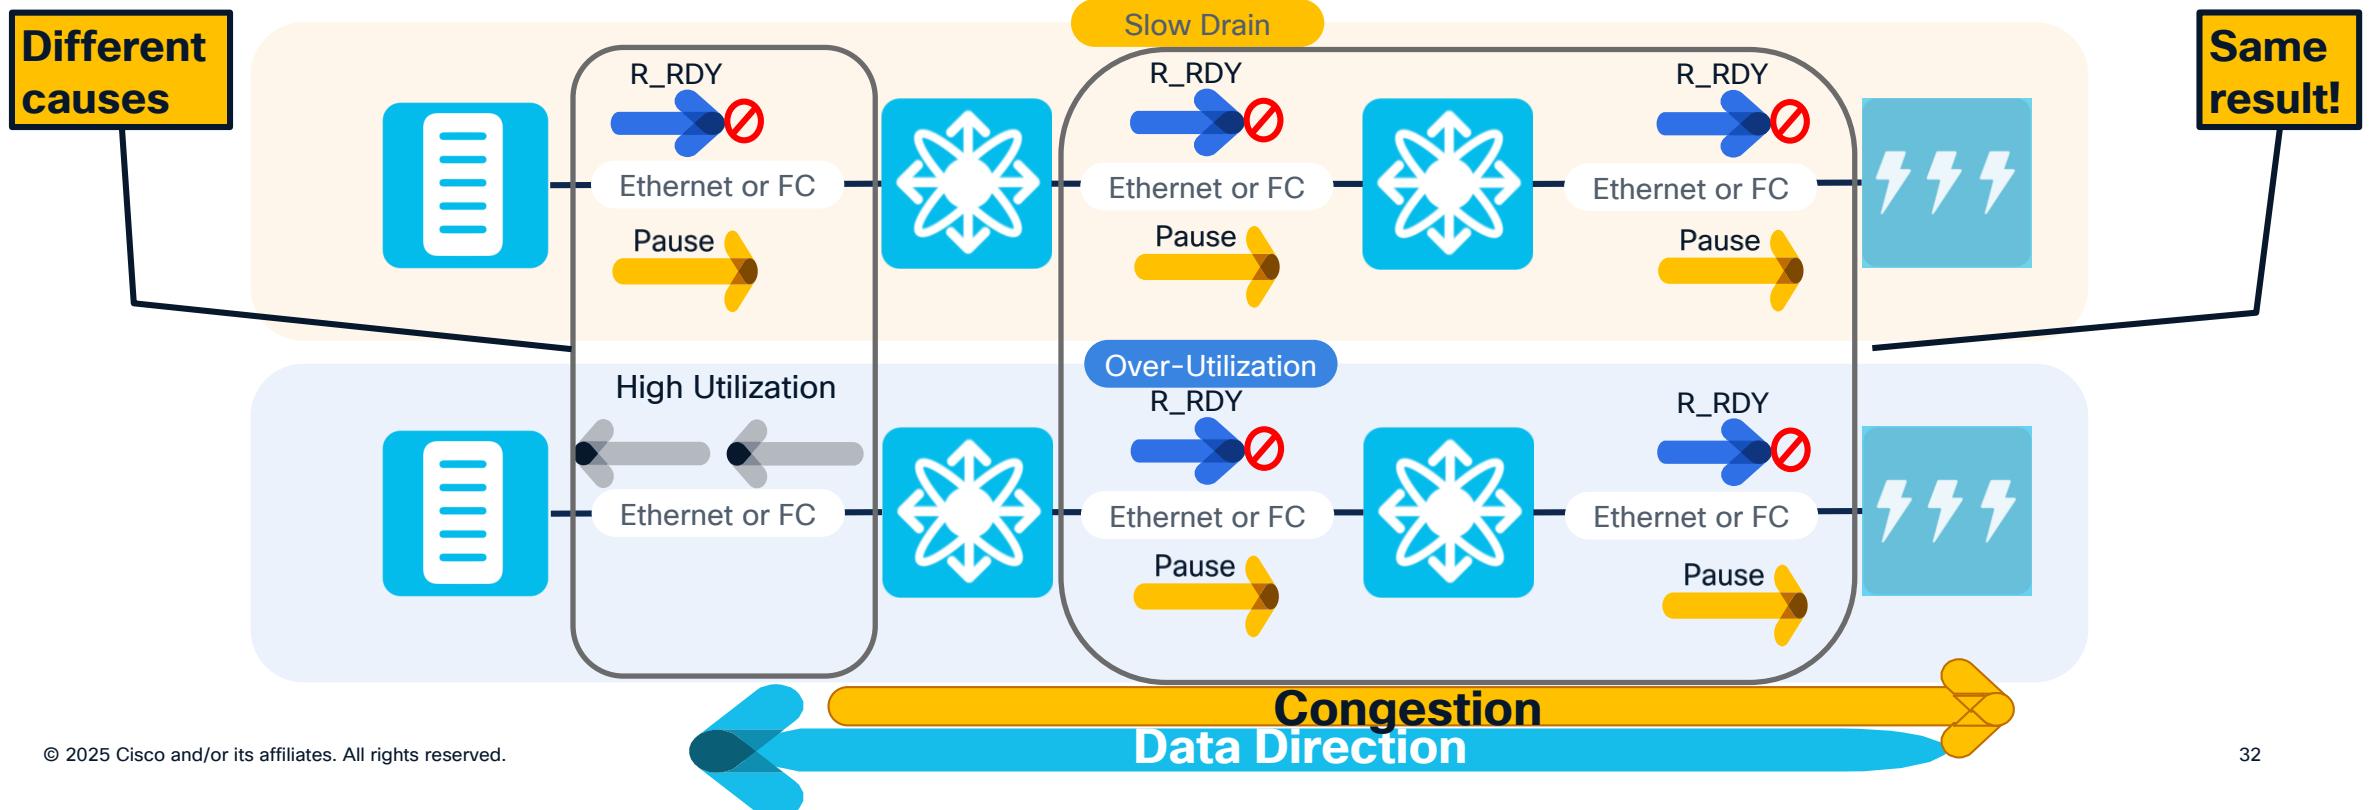

## 1. Slow Drain

- Frame receiver utilizes flow control to reduce the rate of incoming frames

## 2. Over-utilization

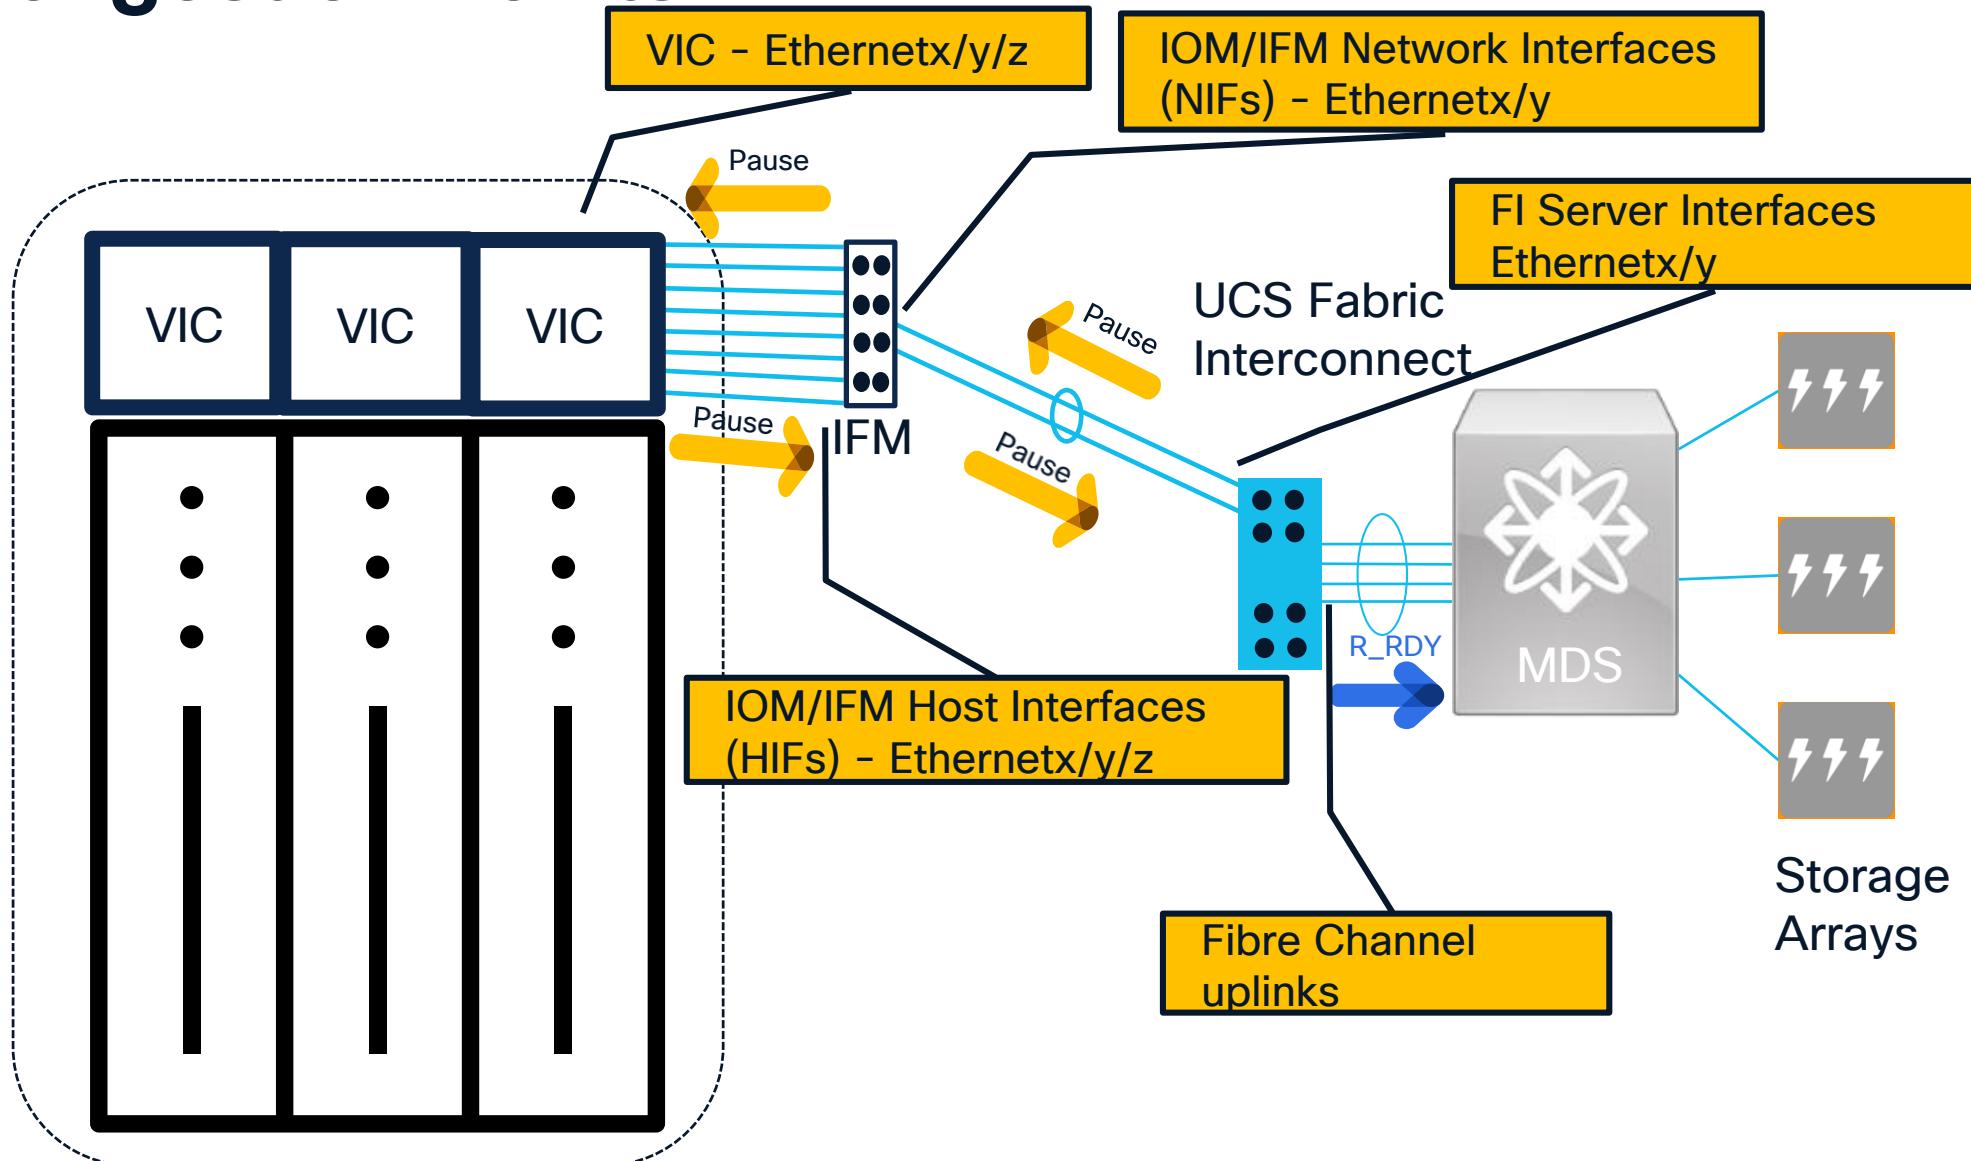

- Tx utilization at or near 100% with more data arriving than can be transmitted at link rate.
- Frame receiver is NOT reducing the rate of incoming frames via flow control

Under both conditions congestion spreads back to the frame senders

# UCS Congestion Points

# UCS Congestion Points

# UCS Congestion Points

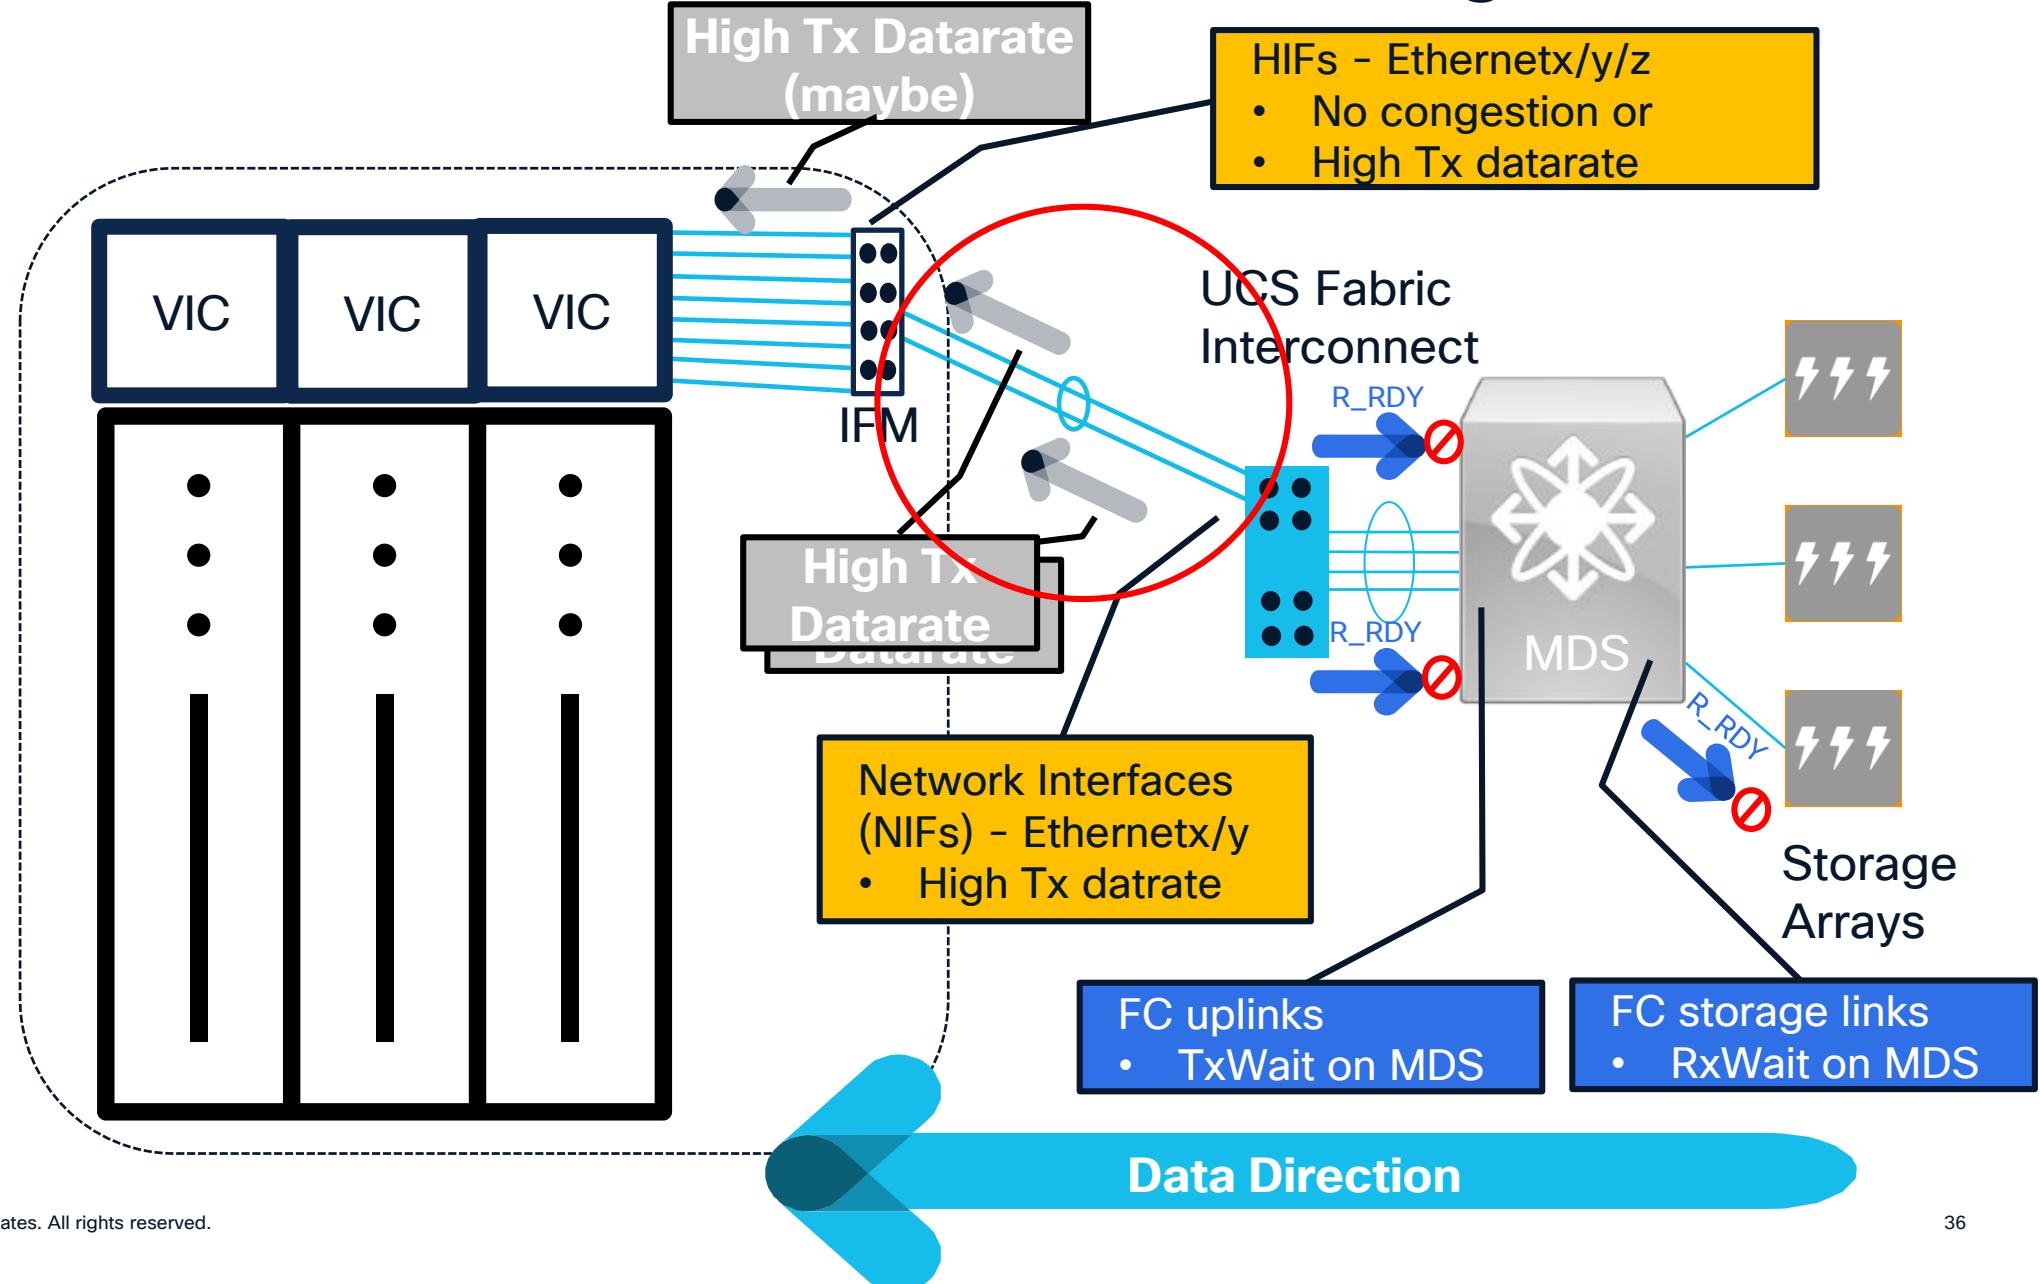

Four possible congestion points in a UCS

1. FC Uplinks
2. Network interfaces (NIFs/FI Server interfaces)
3. Host Interfaces (HIFs)
4. VICs

  

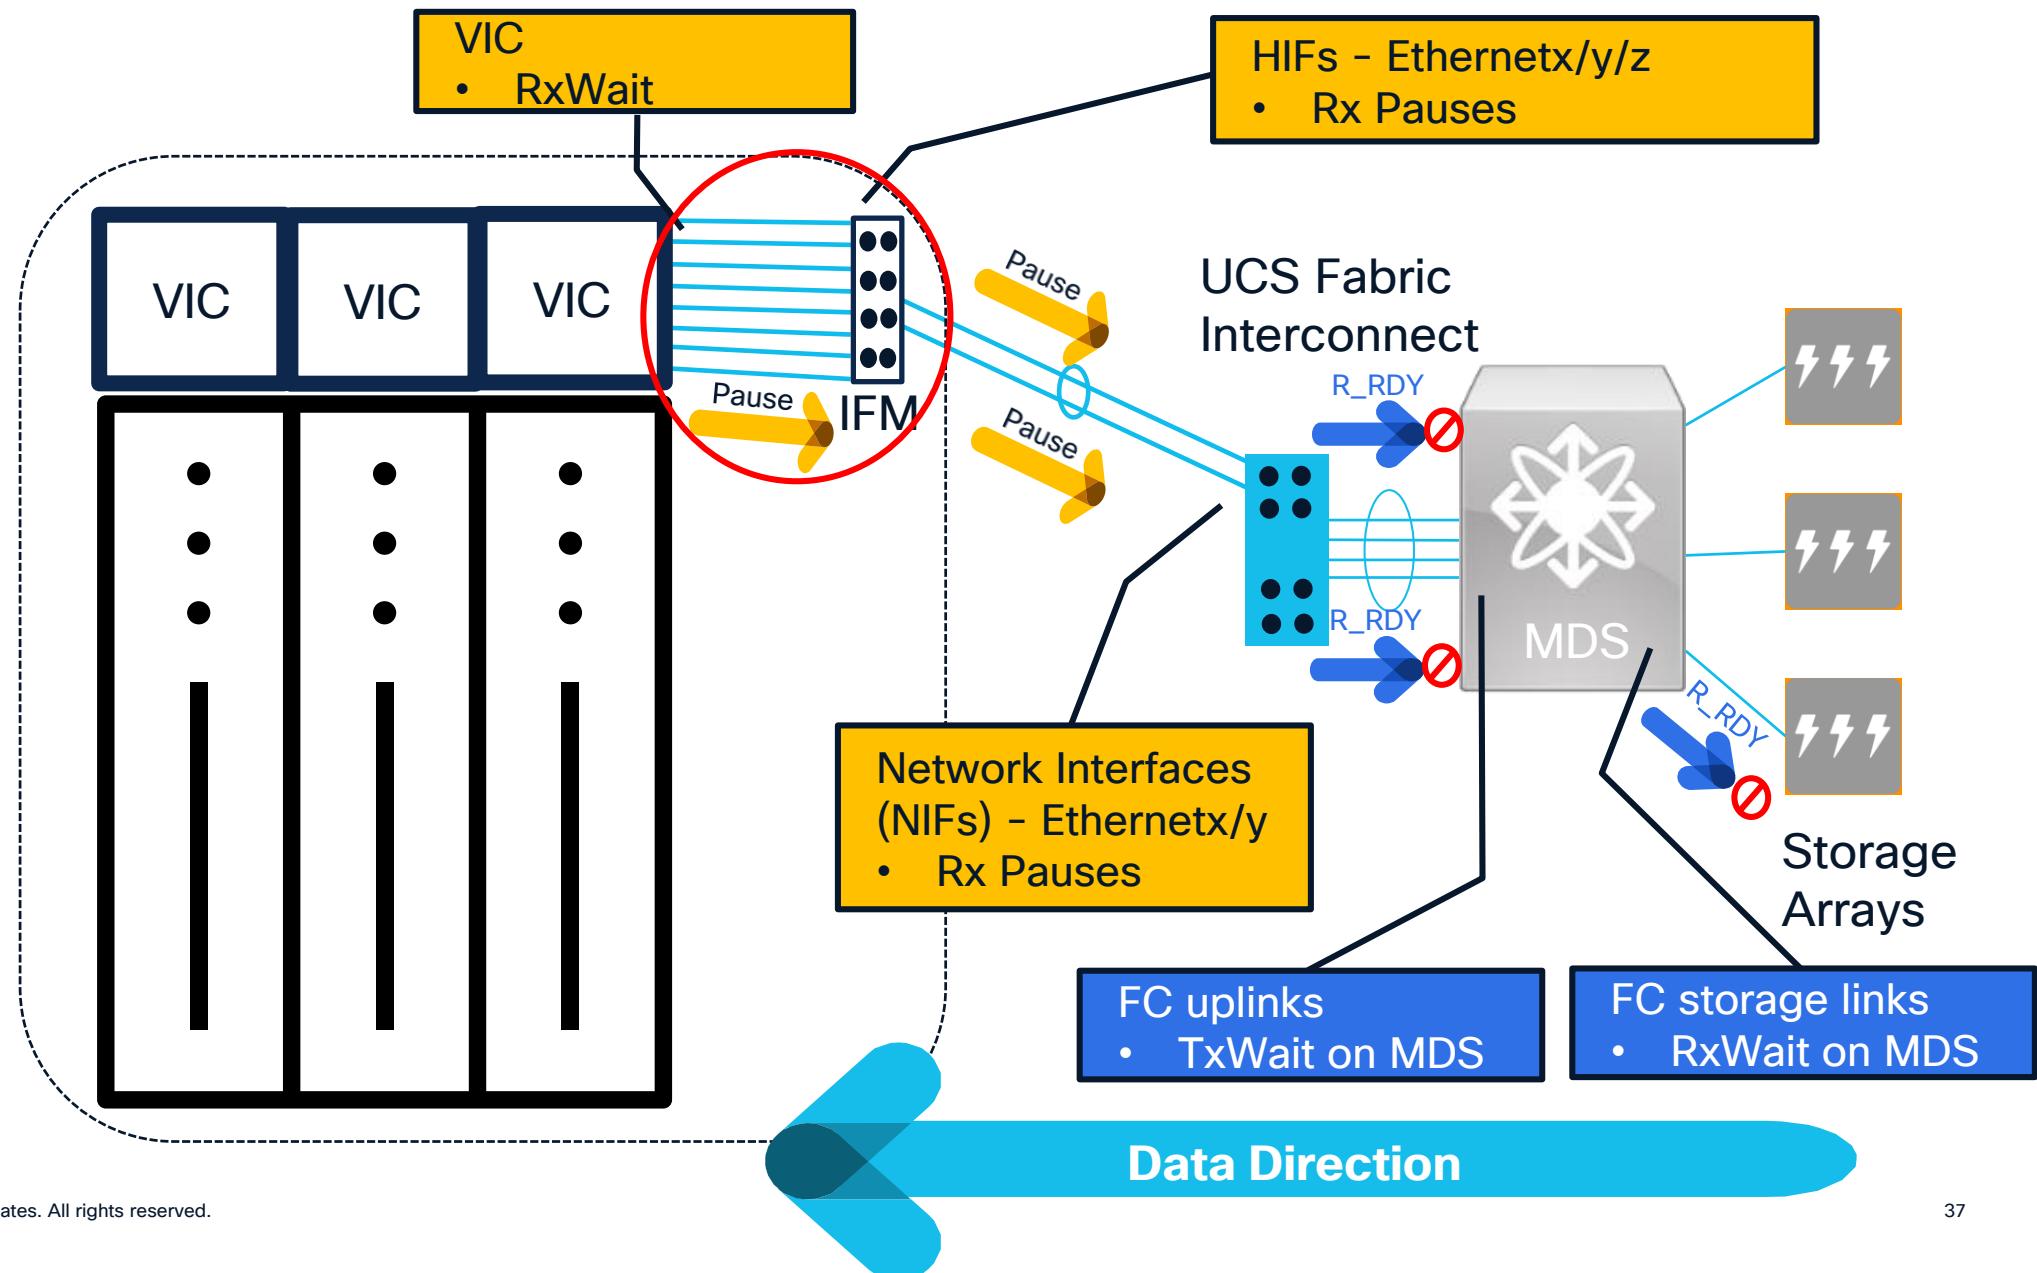

- Two main reasons
  1. Over-utilization – More data being received for the link than it can handle
    - 1a – This includes speed mismatches
  2. Slow Drain – Flow control (Either PFC or B2B) slowing down link.

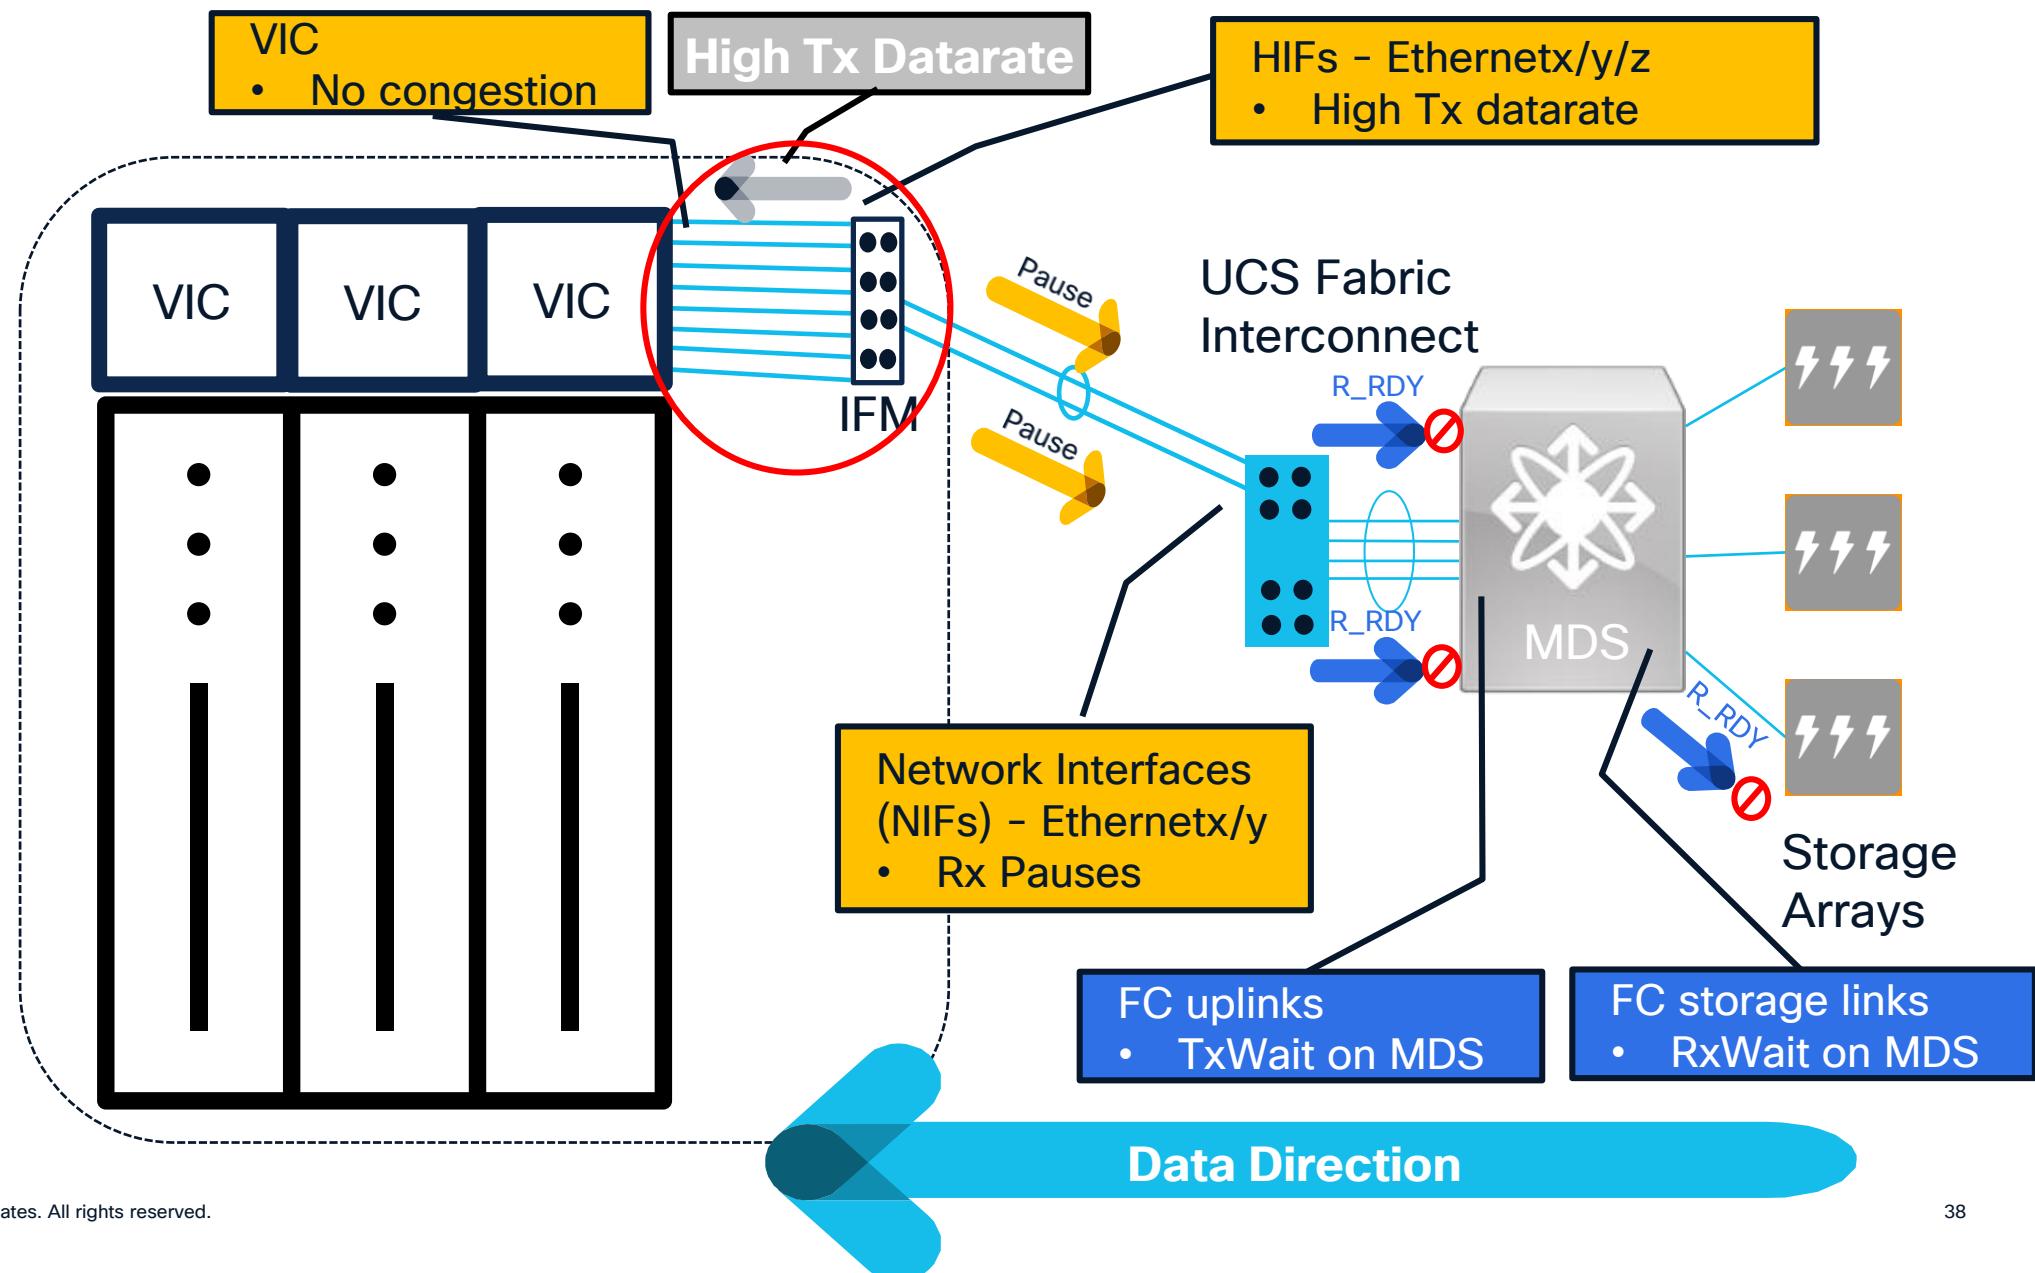

# Scenario 1 – FI to NIF Over-Utilization Congestion

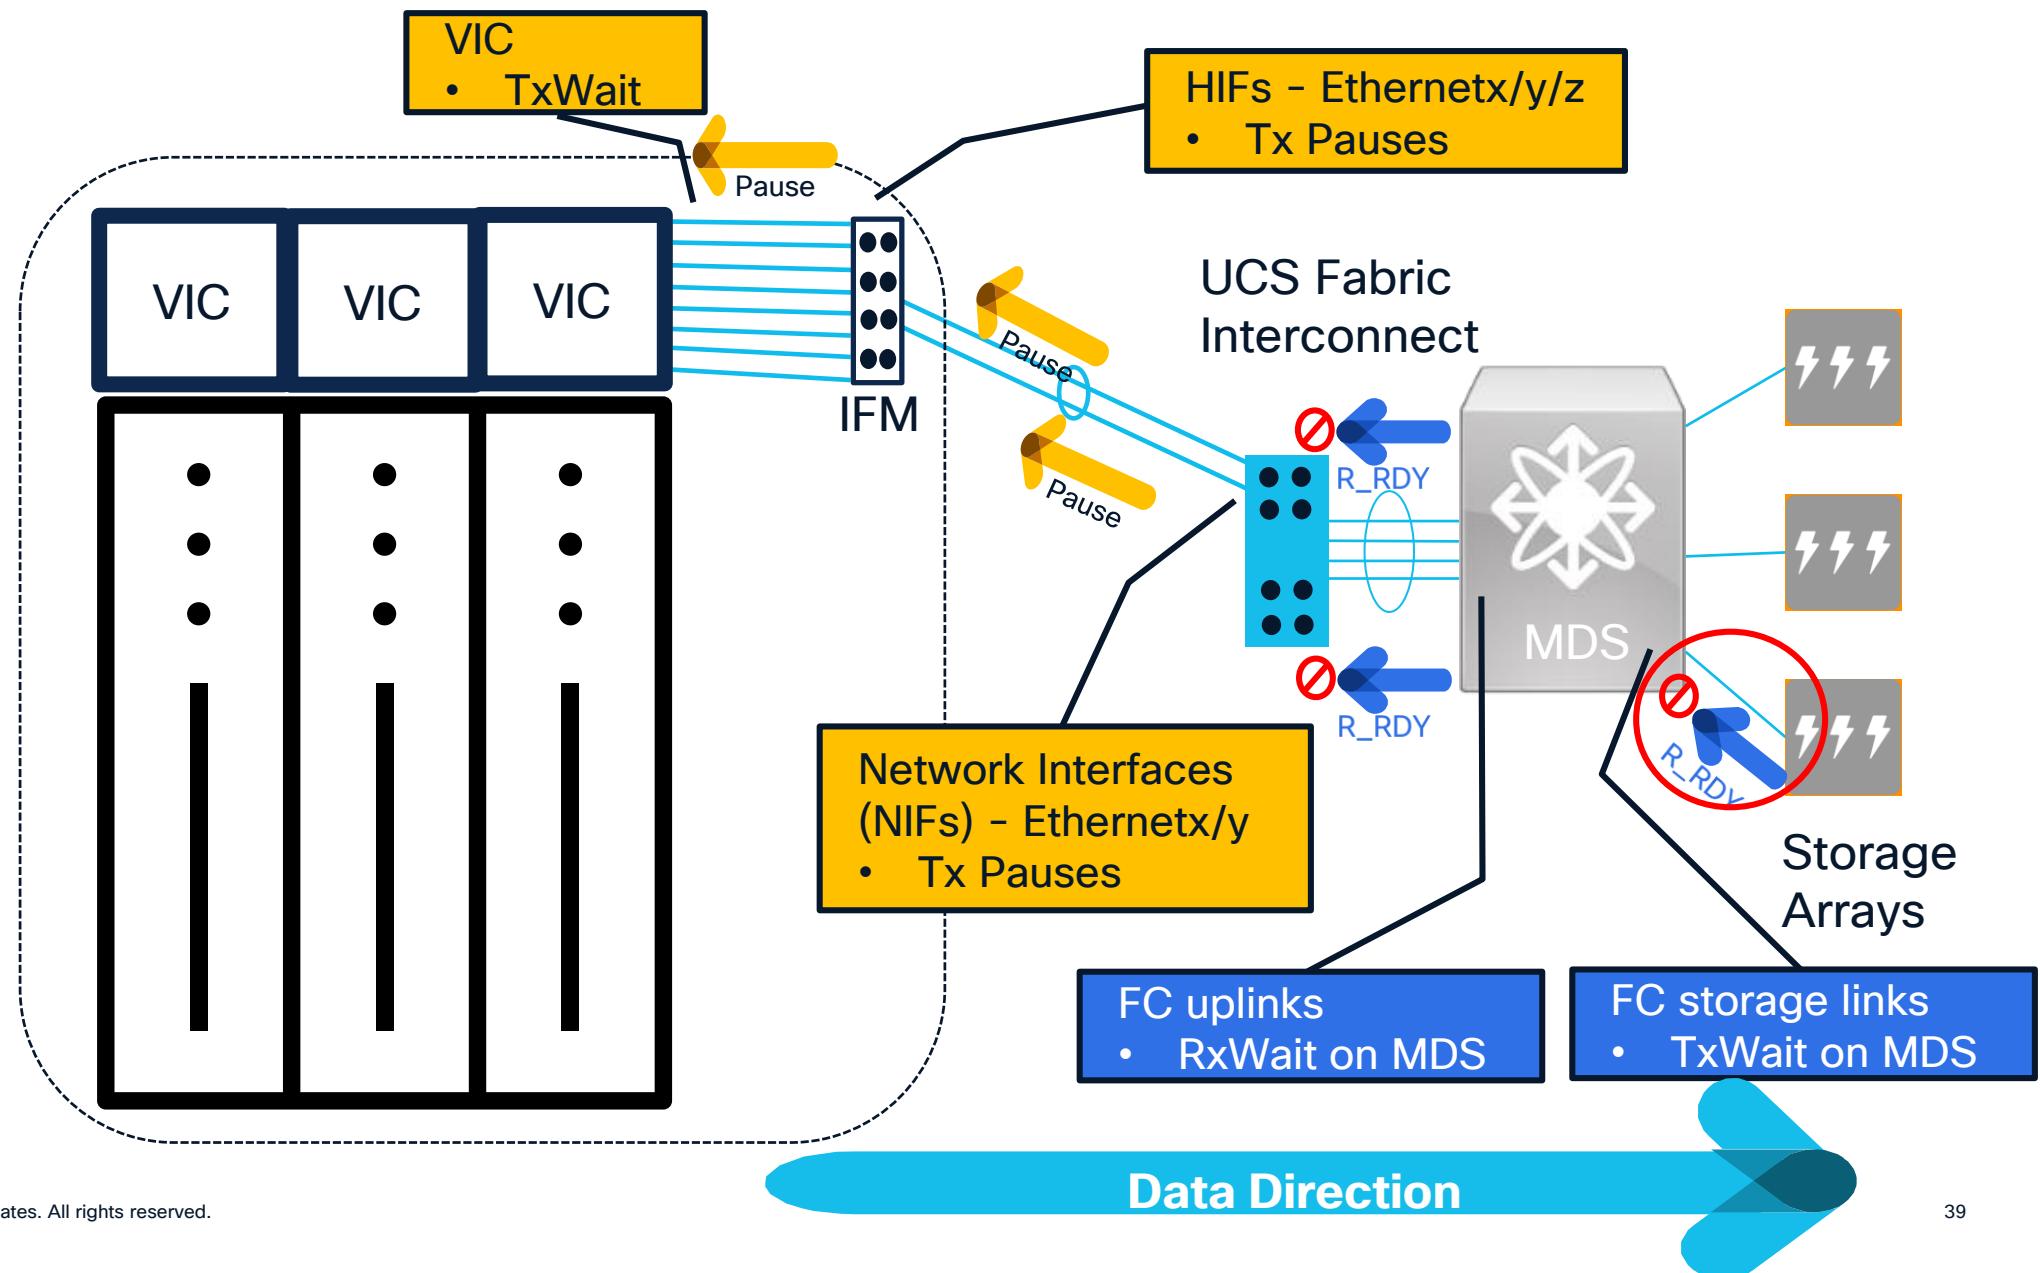

# Scenario 2 – VIC to HIF Slow Drain Congestion

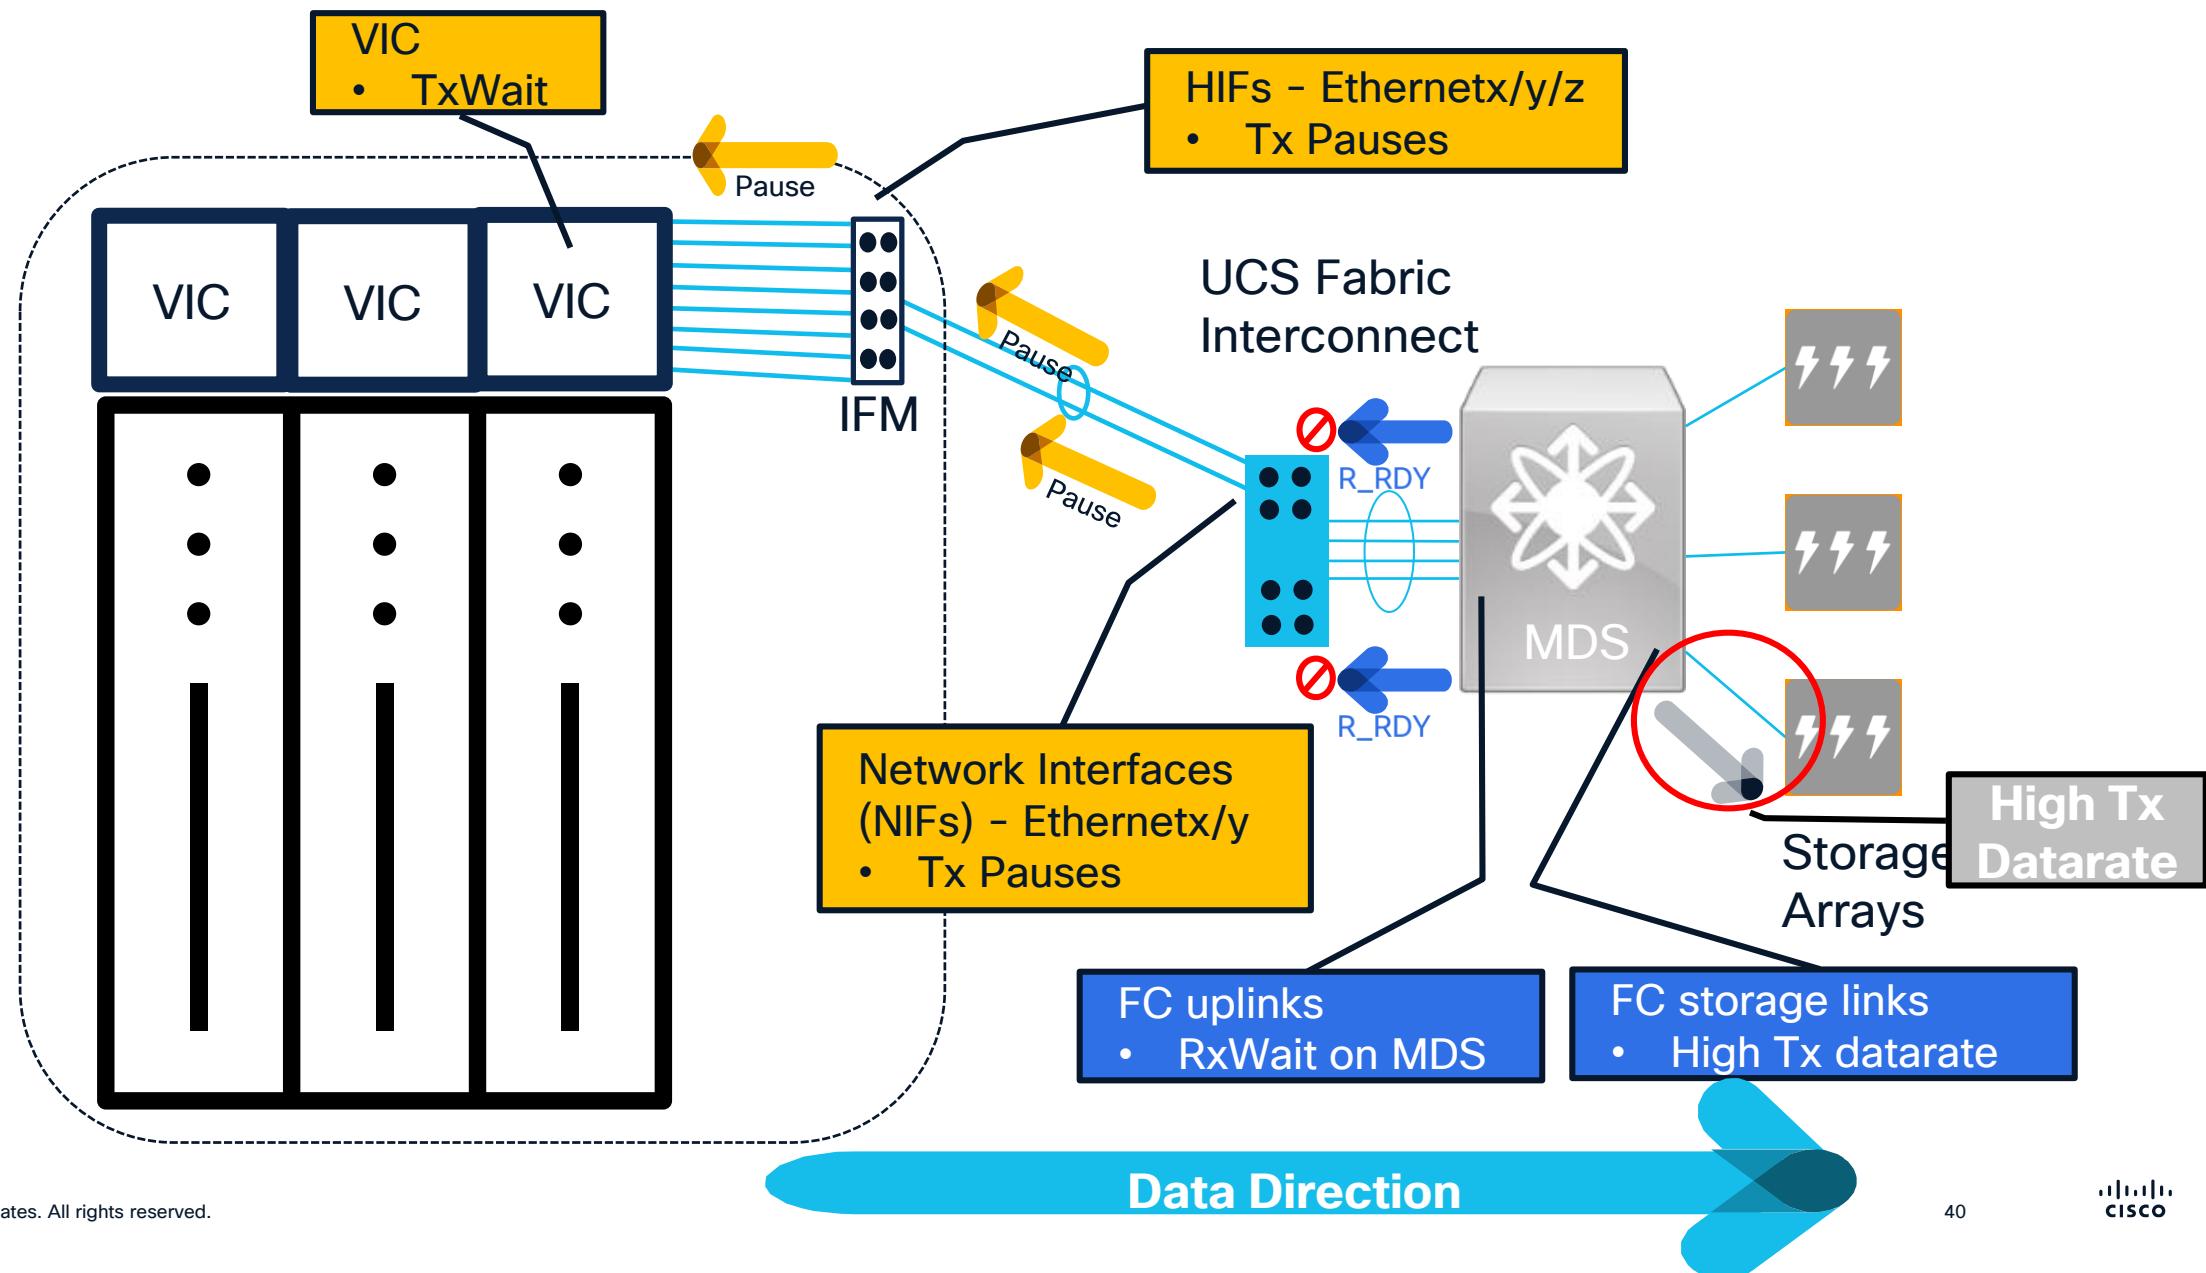

## Scenario 3 – HIF to VIC Over-Utilization Congestion

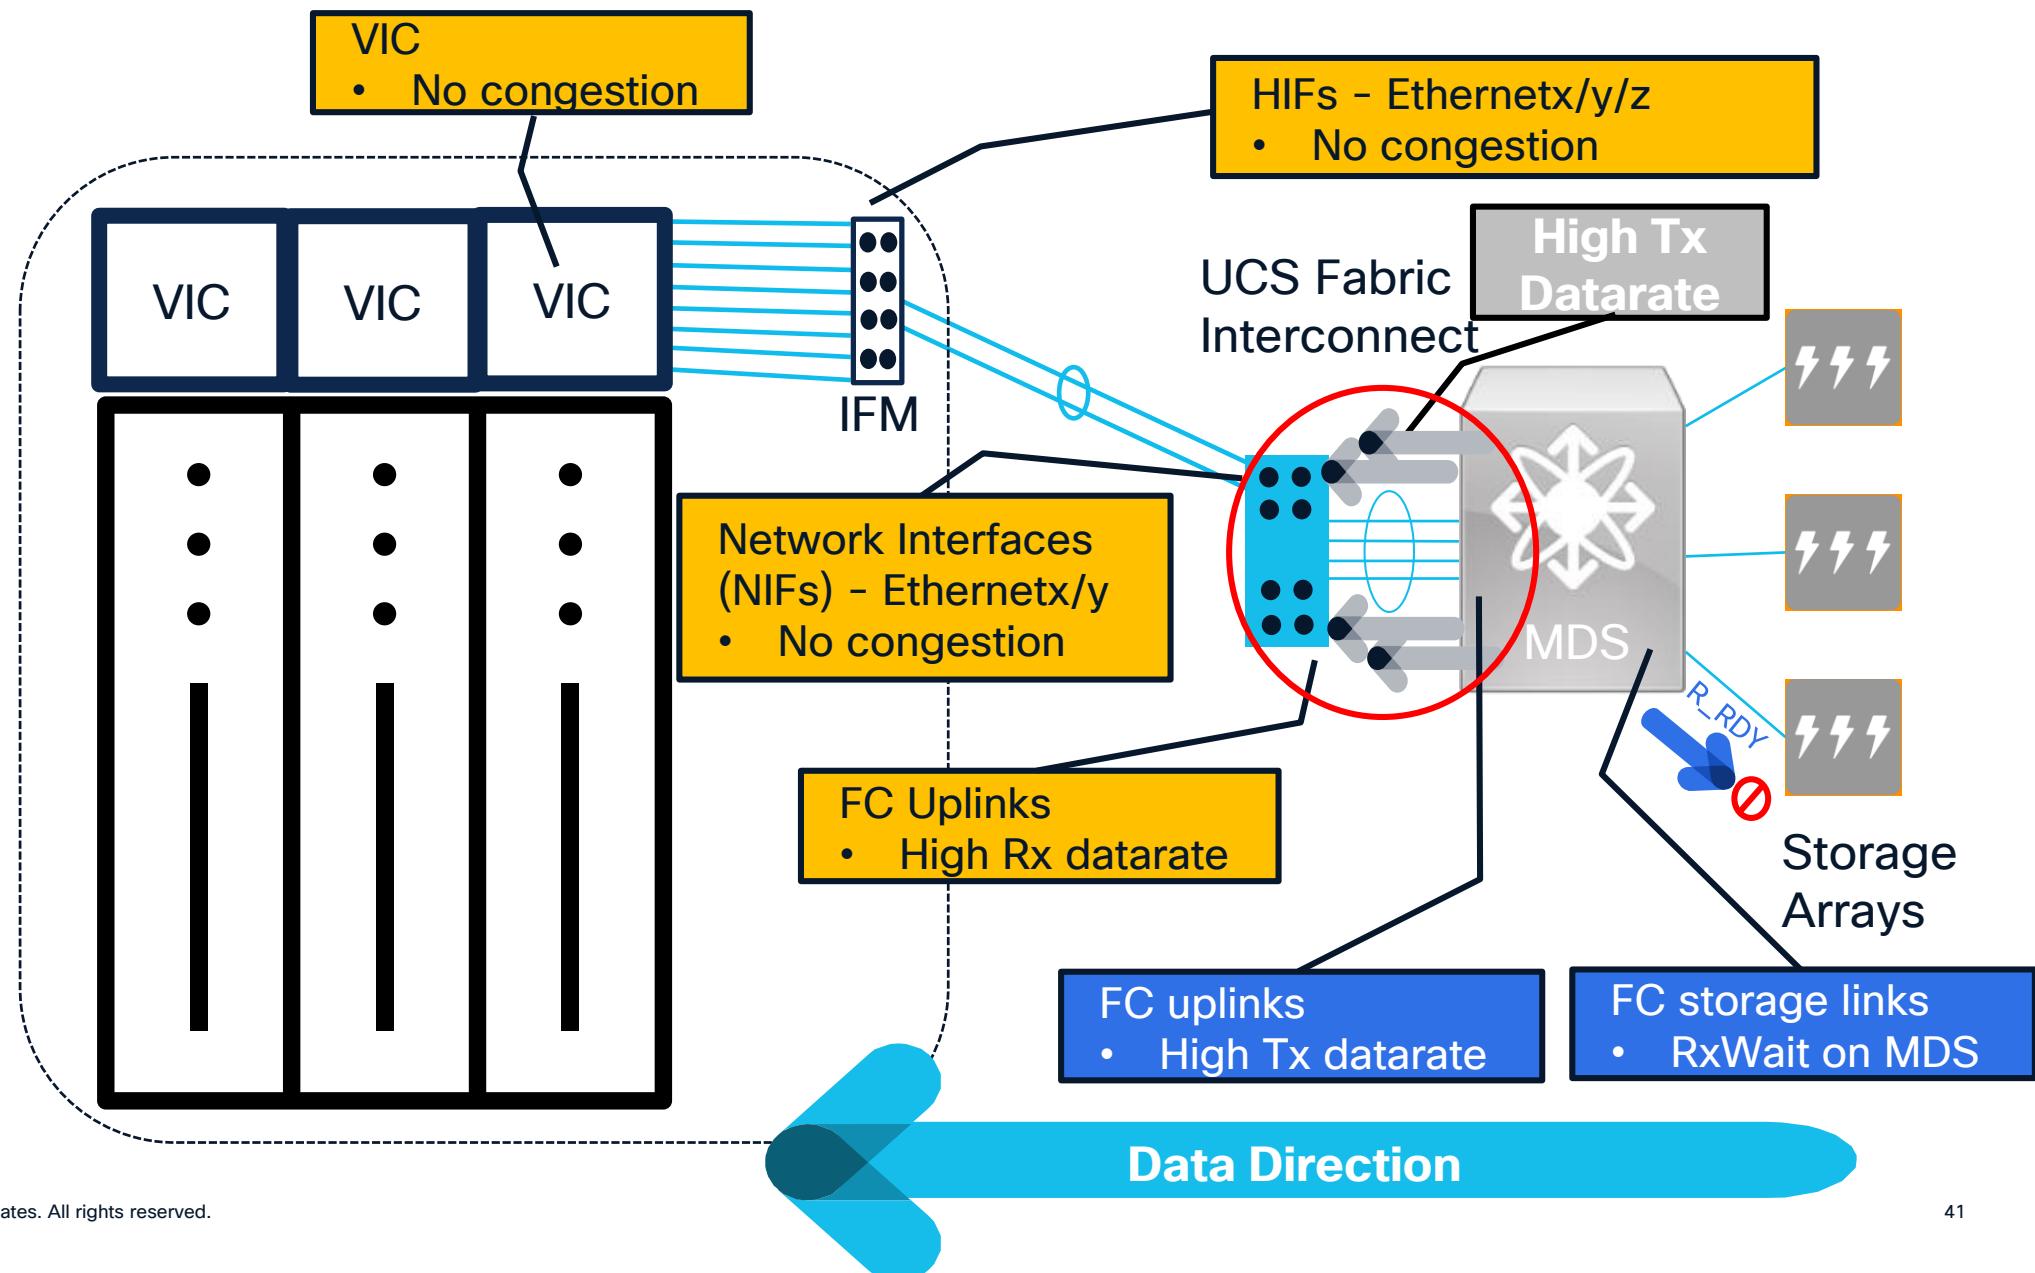

# Scenario 4 – Array Slow Drain Congestion

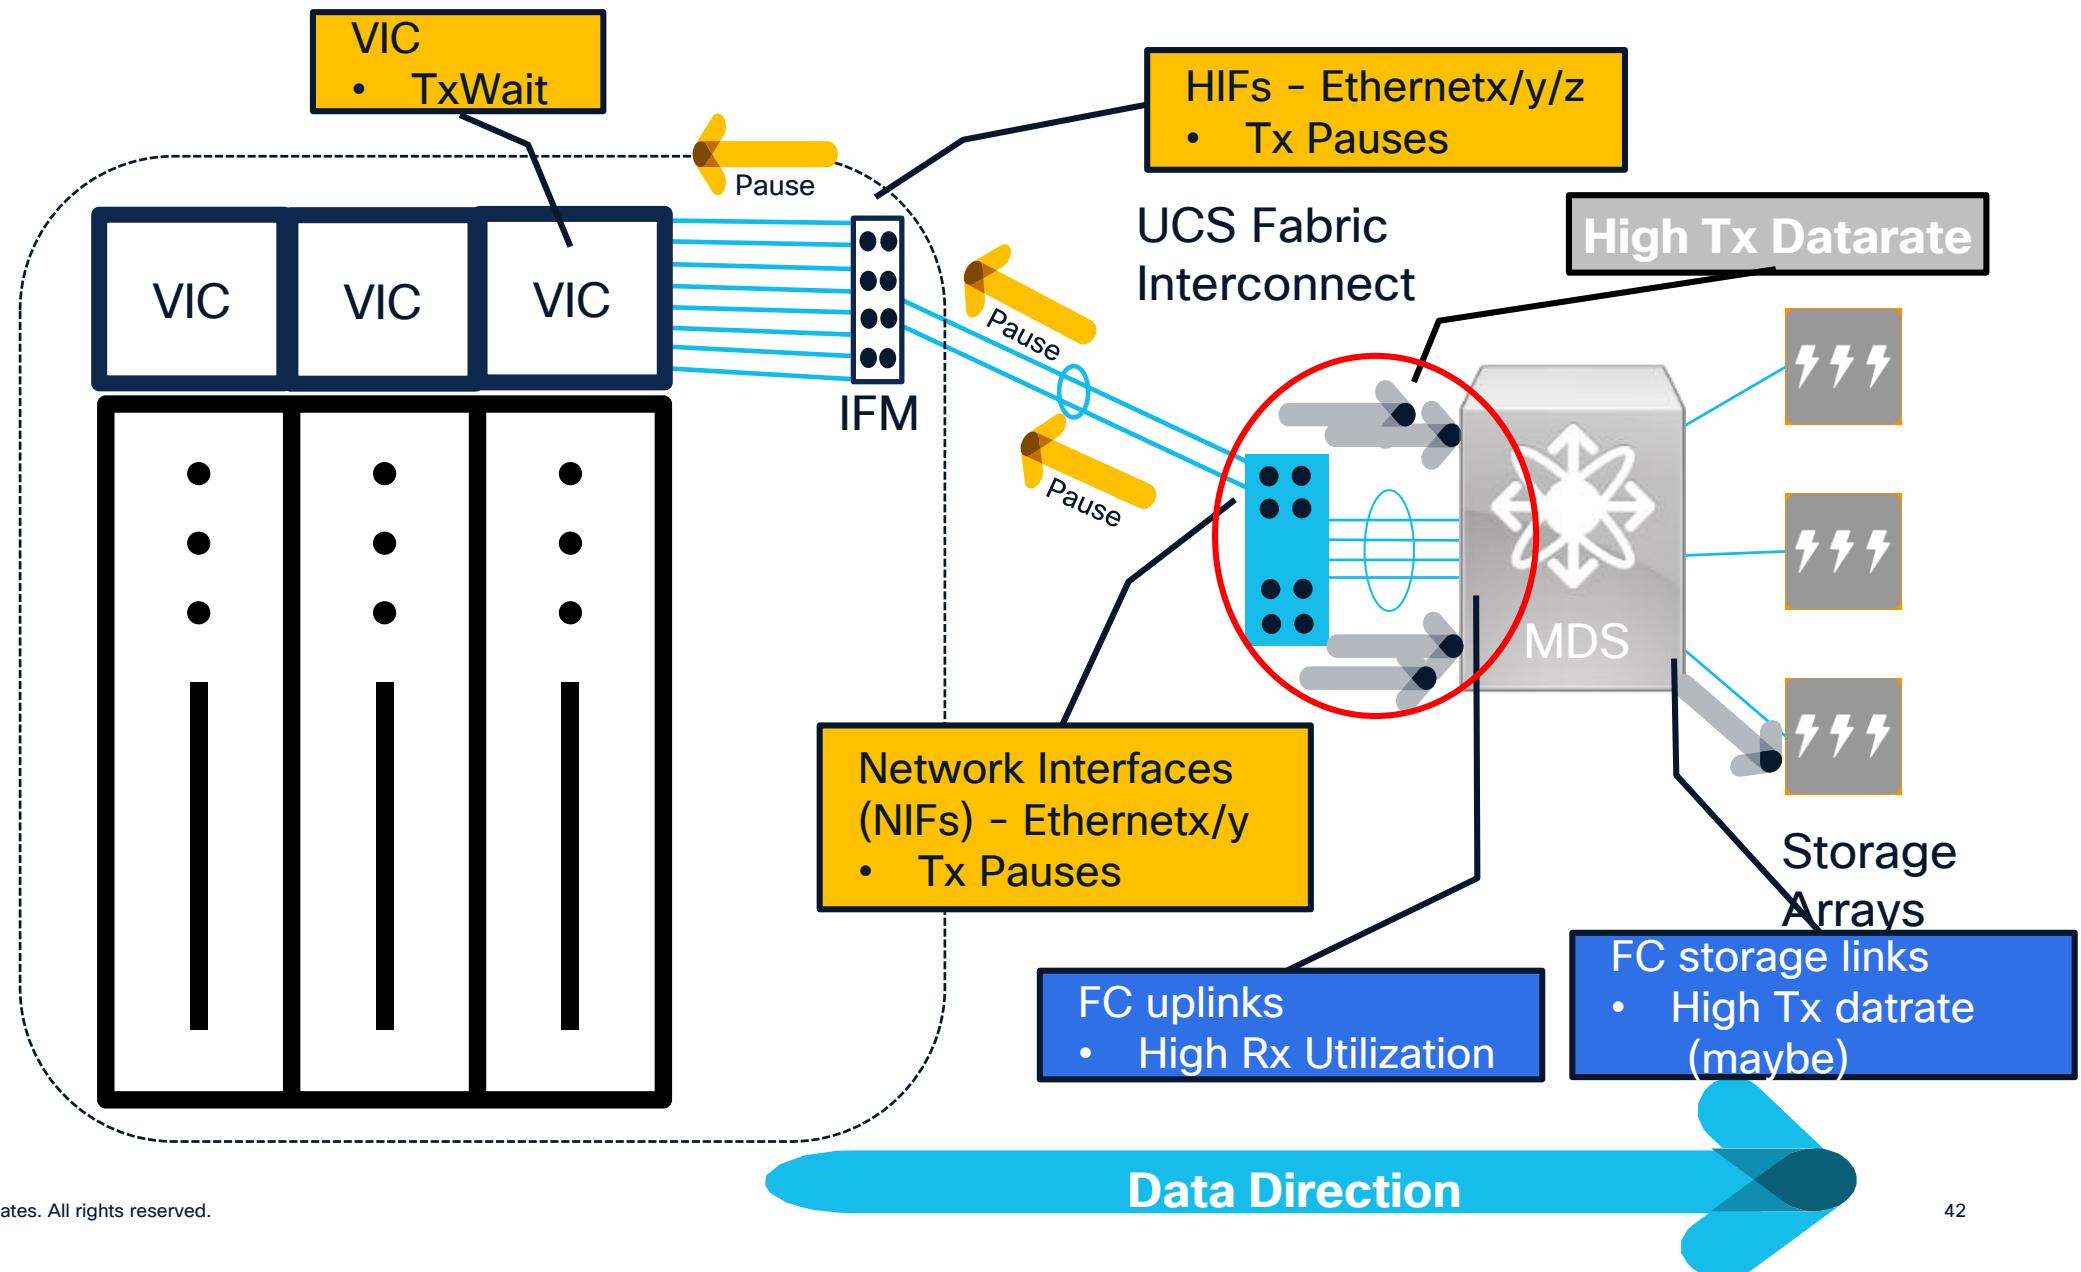

# Scenario 5 – Array Tx Over-Utilization Congestion

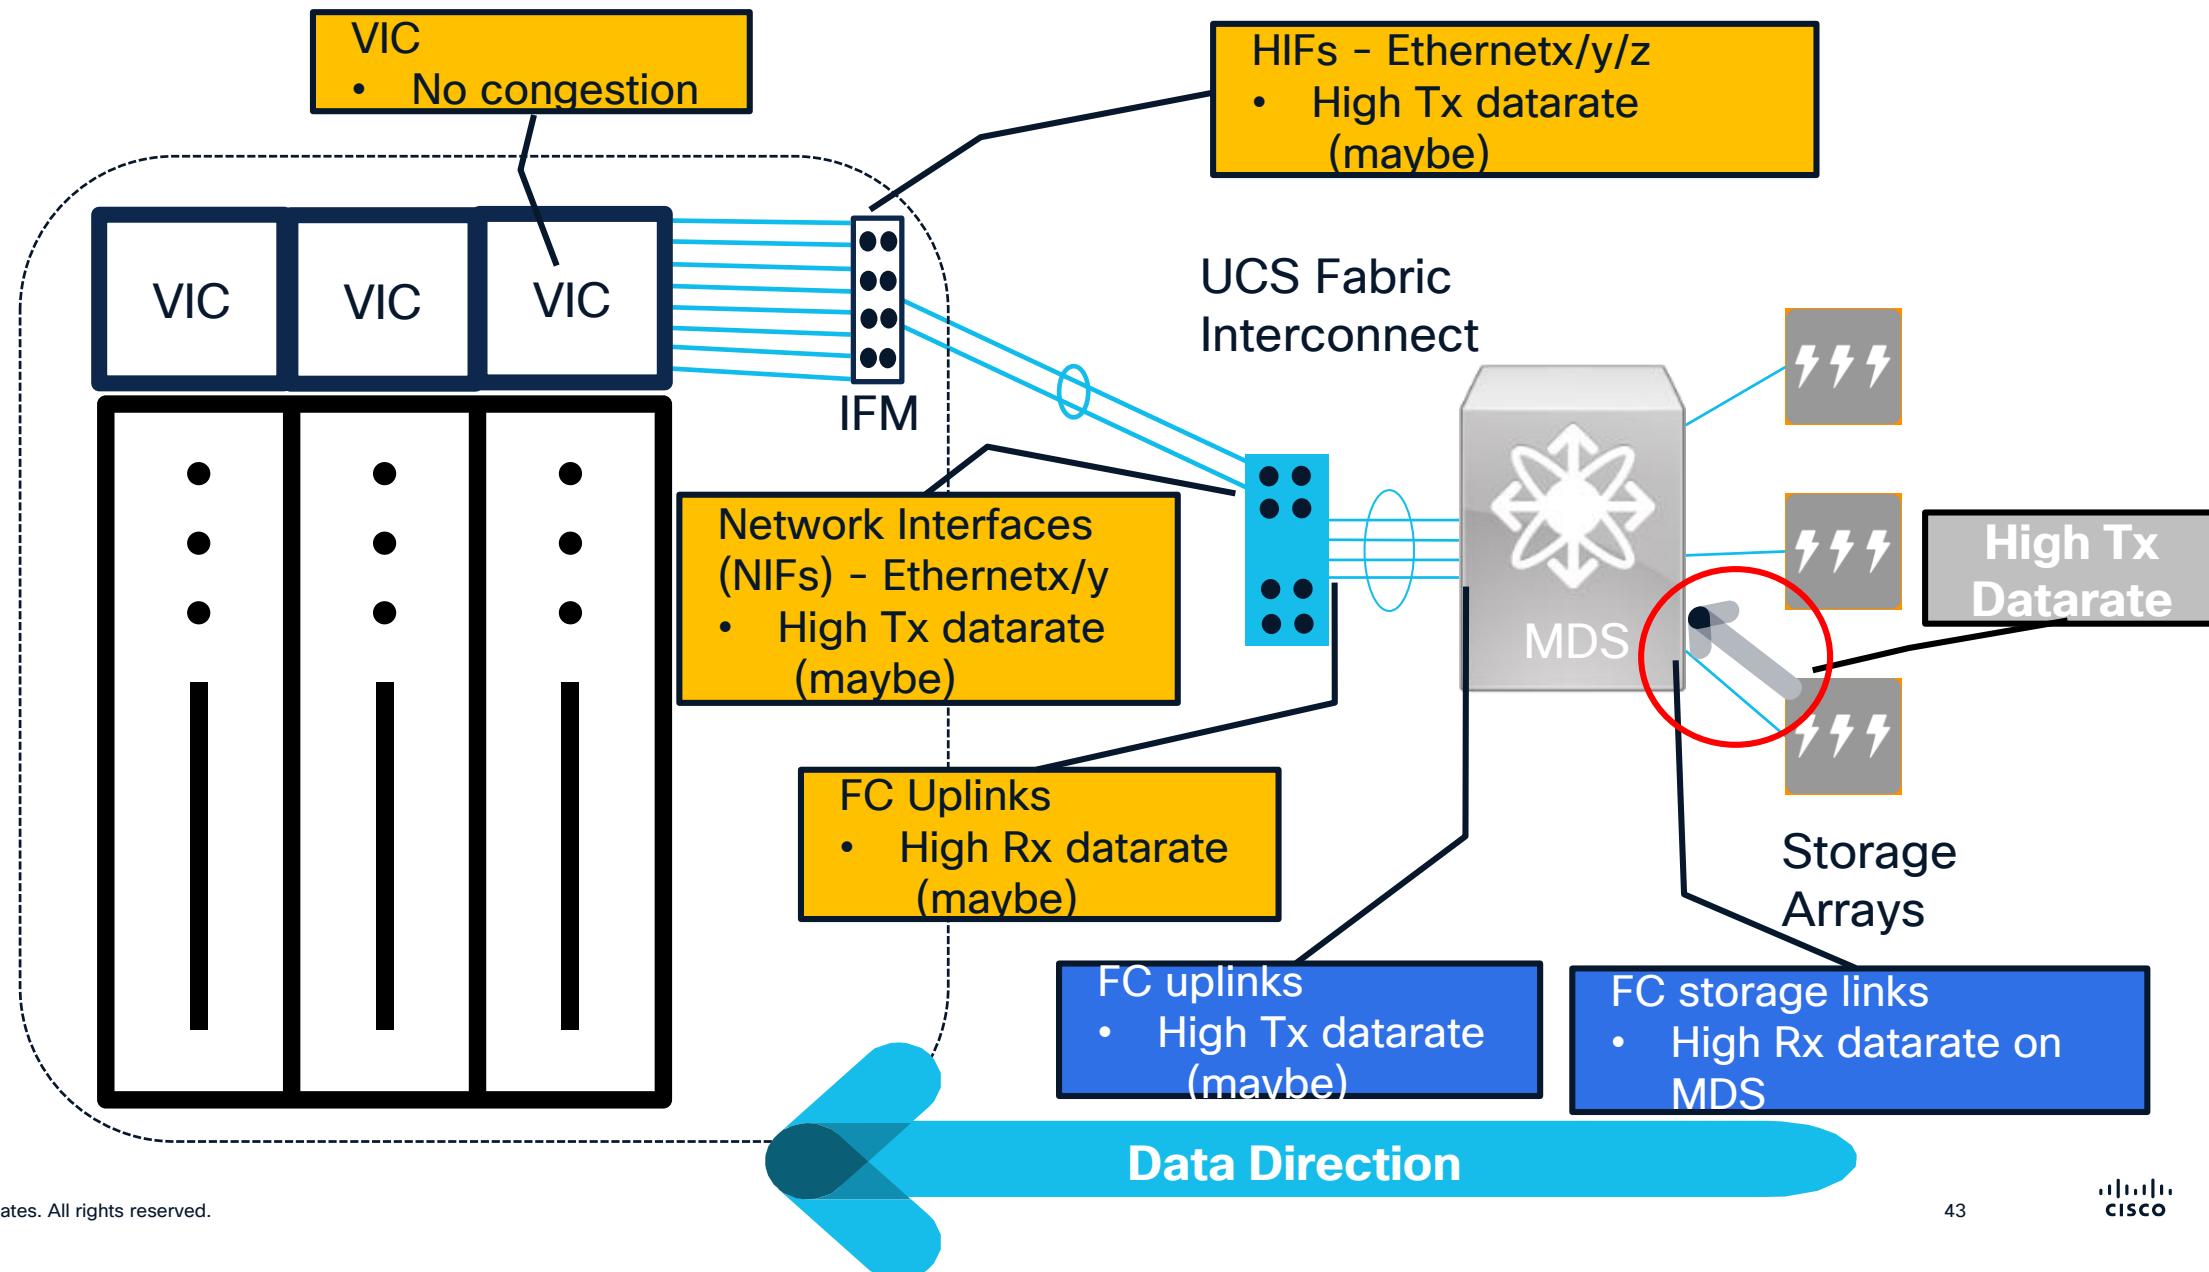

# Scenario 6 - FC Uplink Over-Utilization Congestion

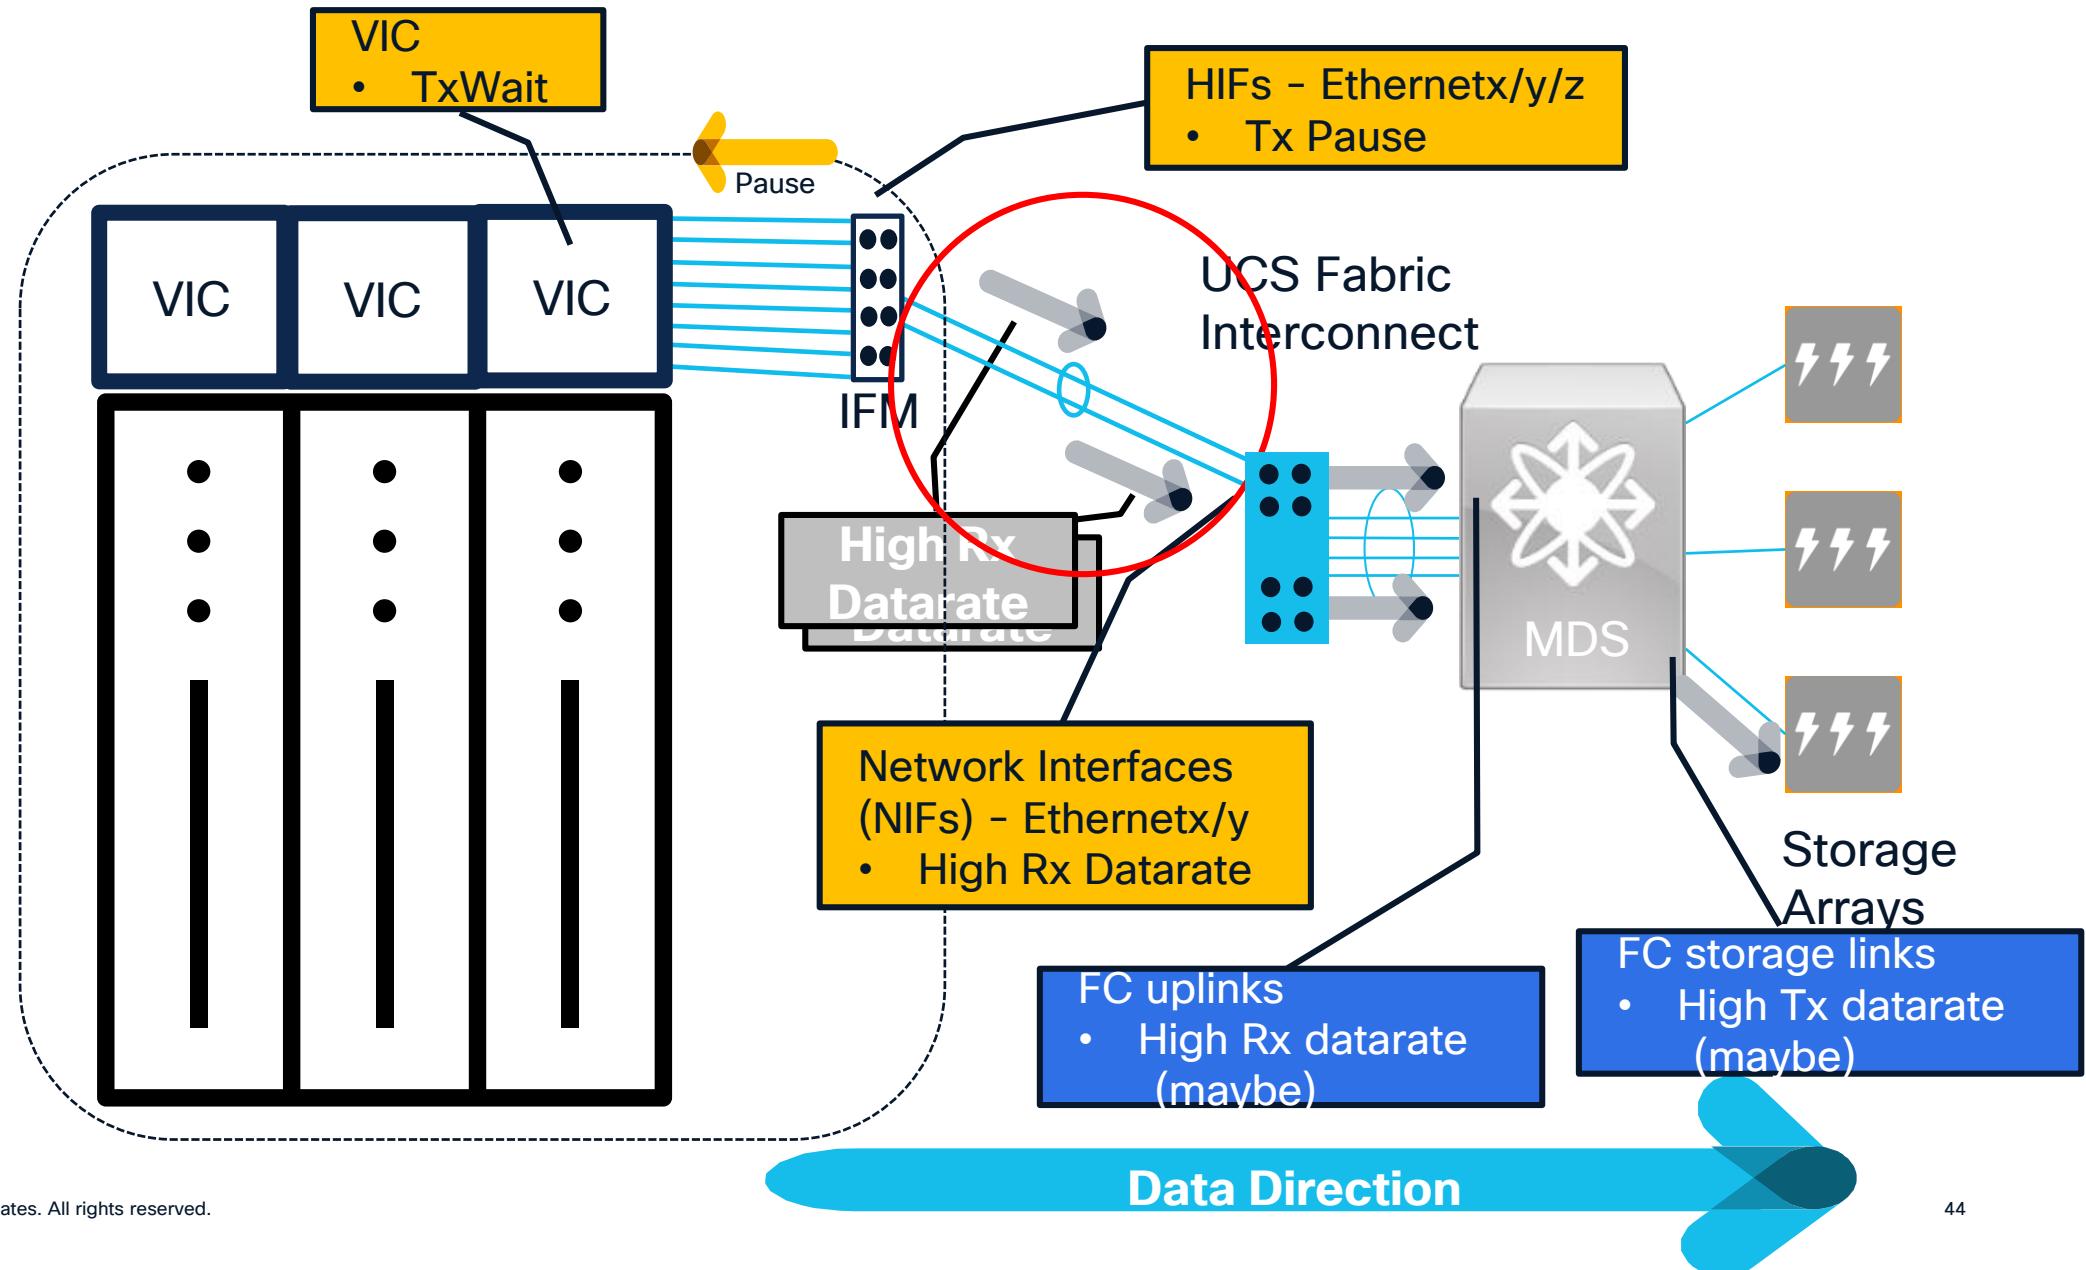

# Scenario 7 - FC Uplink Over-Utilization Congestion

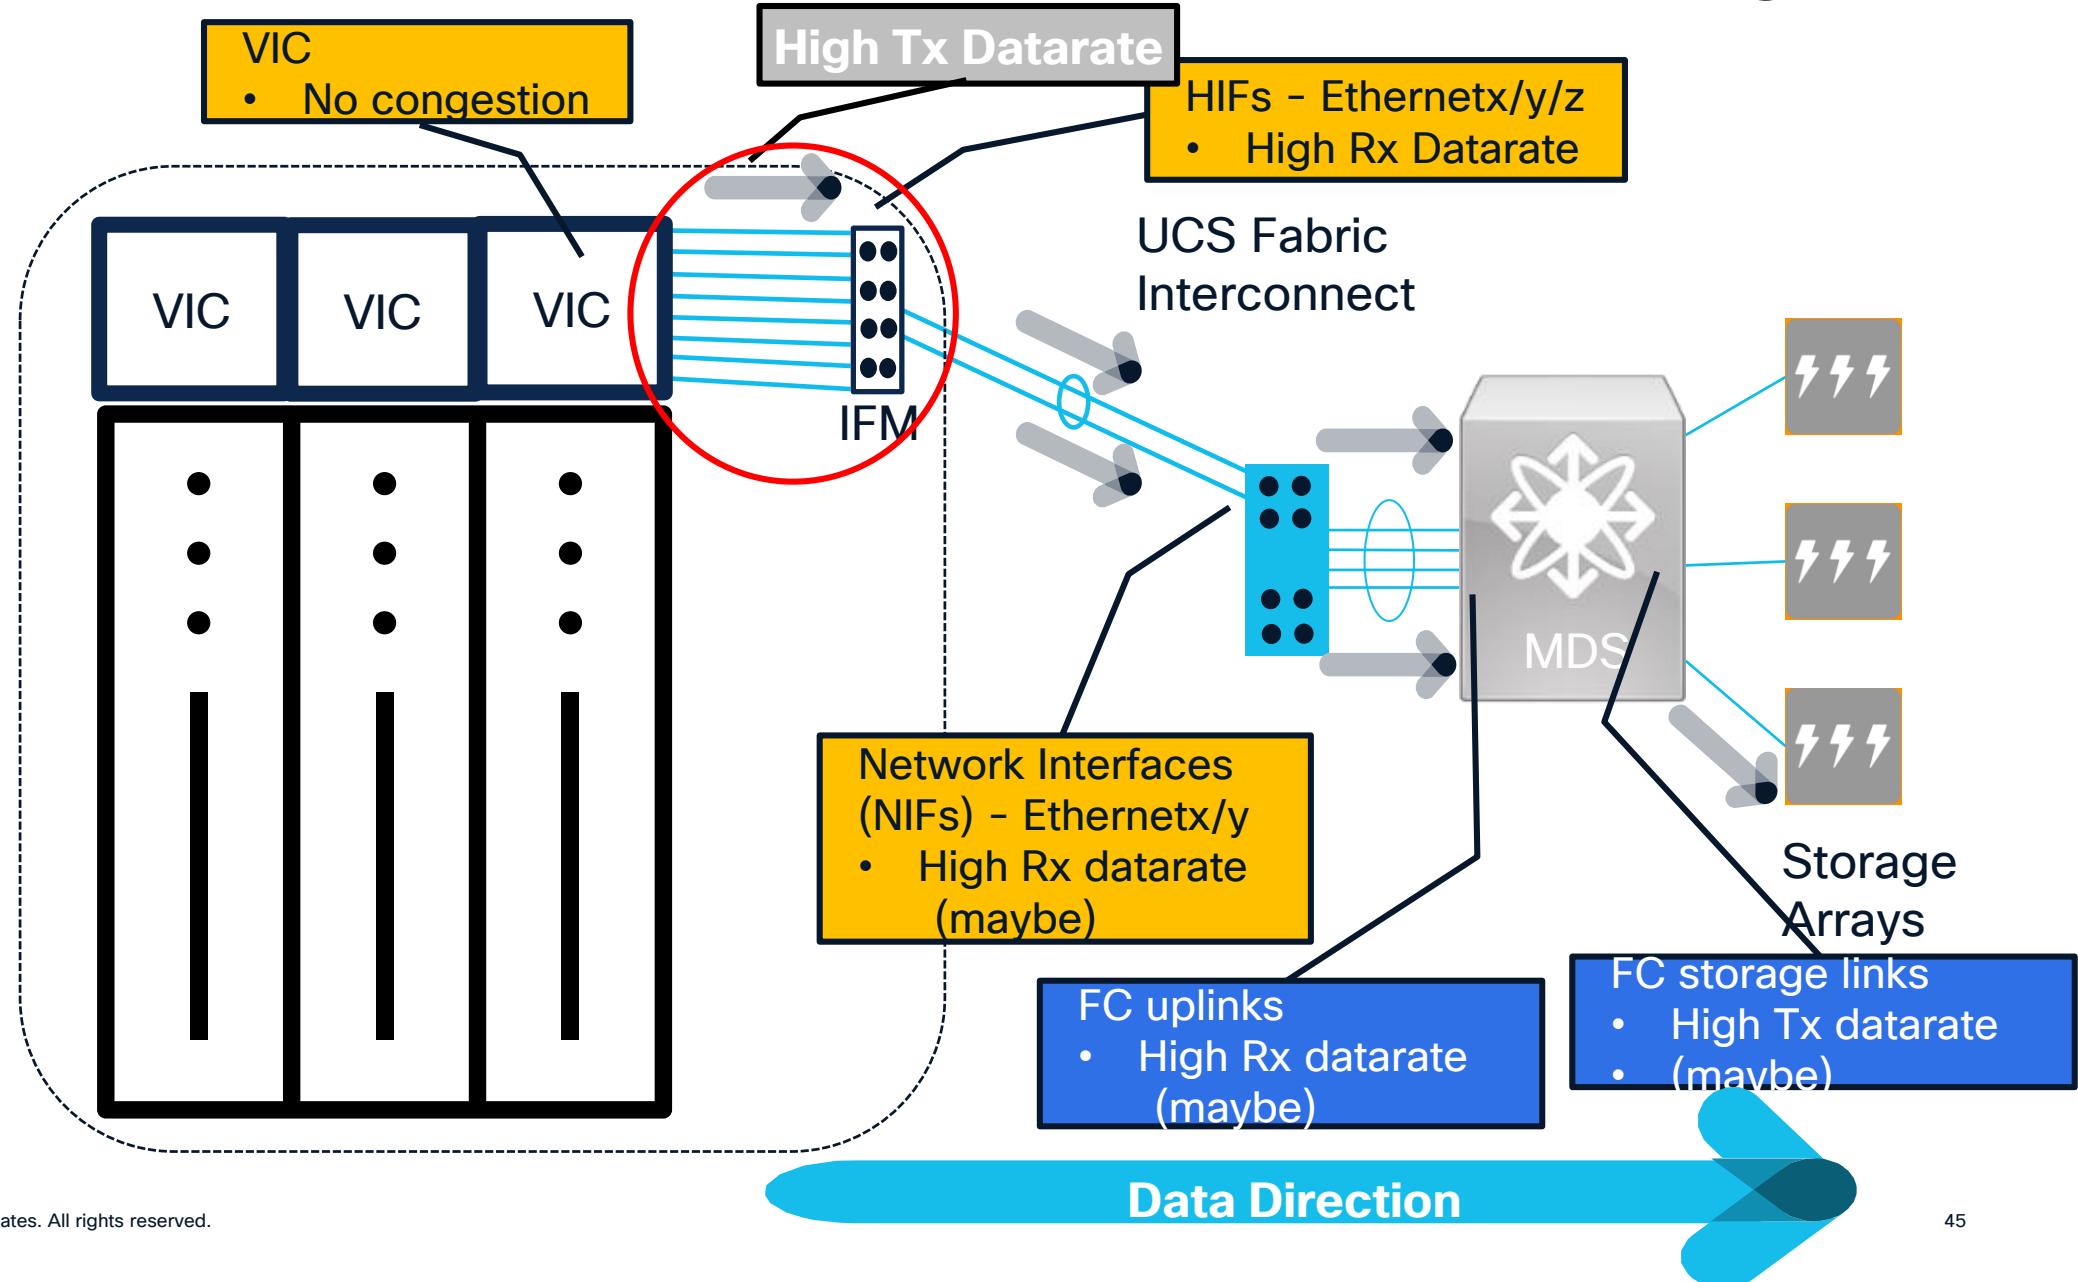

# Scenario 8 - Array Rx Over-Utilization Congestion

# Scenario 9 - NIF to FI Over-Utilization Congestion

# Scenario 10 – VIC to HIF link Over-Utilization Congestion

# Troubleshooting Workflows

# Culprits and Victims

New terminology to describe devices causing problems and those affected

## Culprits

Those devices **causing** congestion

## Victims

Those devices **affected** by the congestion

Three types

1. **Direct** – Devices zoned with the culprit
2. **Indirect** – Devices zoned with the “direct: **or** “same-path” victims
3. **Same-path** – Devices **transmitting** over the congested network path

Understanding culprits and victims explains the scope of the congestion

See the following session for more details:

BRKDCN-2942 - SAN Congestion Management and SAN Analytics – Thursday June 12th 10:30 AM

# “Normal” congestion

Due to different link speeds between FC and Ethernet there can be **normal** PFC pauses

Ethernet has speeds: 10G, 25G, 40G, 100G etc.

Fibre Channel has speeds: 8G, 16G, 32G and 64G

As an FCoE exchange traverses different link speeds bottlenecks may be encountered

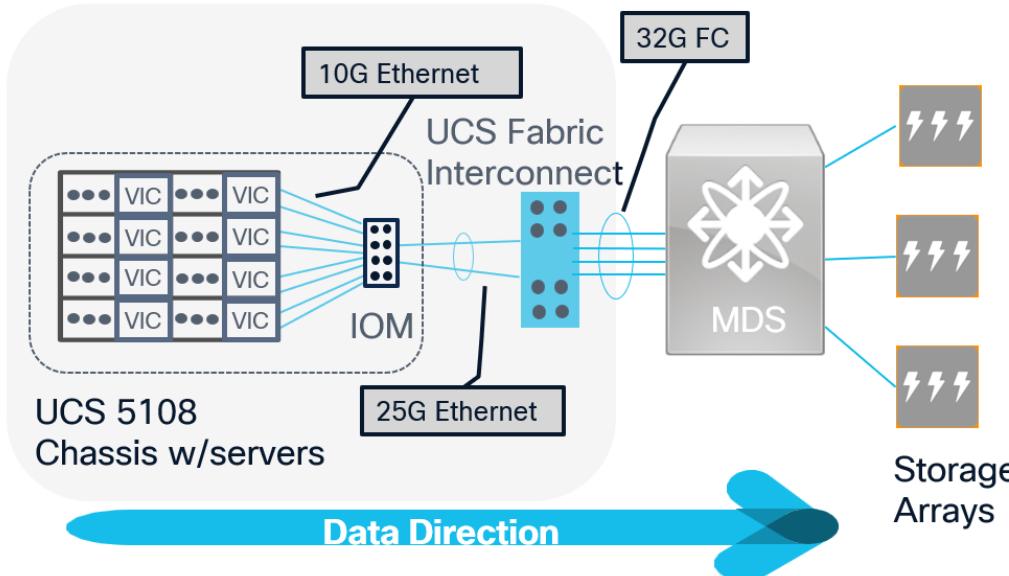

FCoE exchanges are mapped to individual links to ensure in-order delivery

This will result in PFC Pauses being sent to equalize transmission rates

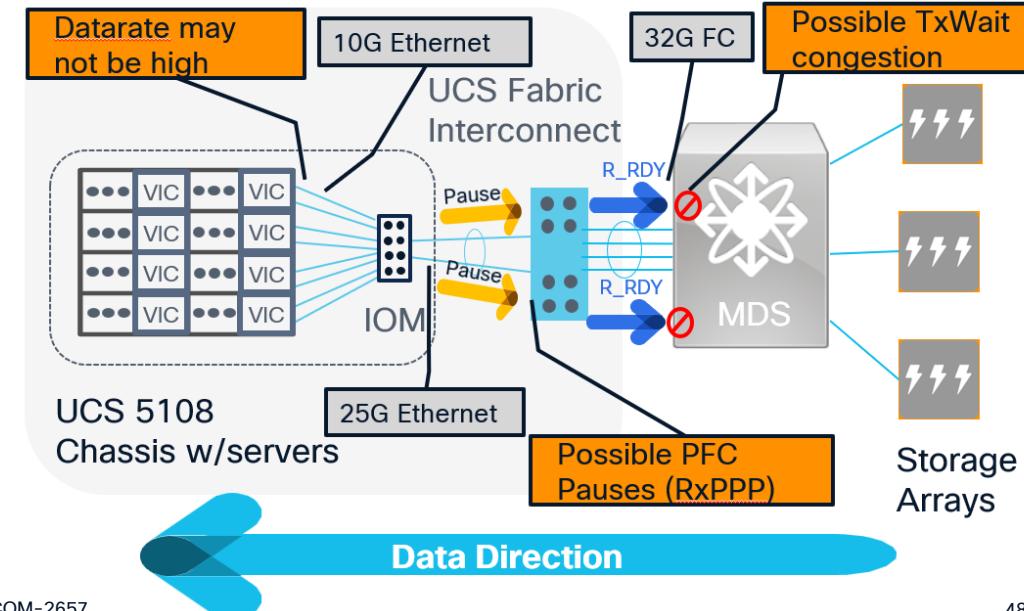

These can be minimized but cannot be completely avoided!

PFC Pauses are a normal occurrence and will not normally be zero

## No bottlenecks

## Bottlenecks!

# UCS Congestion Troubleshooting Methodology

- SCSI/NVMe Read commands generate data towards the servers/VICs
- SCSI/NVMe Write commands generate data away from the servers/VICs

## Follow Tx congestion to the source to find the culprit

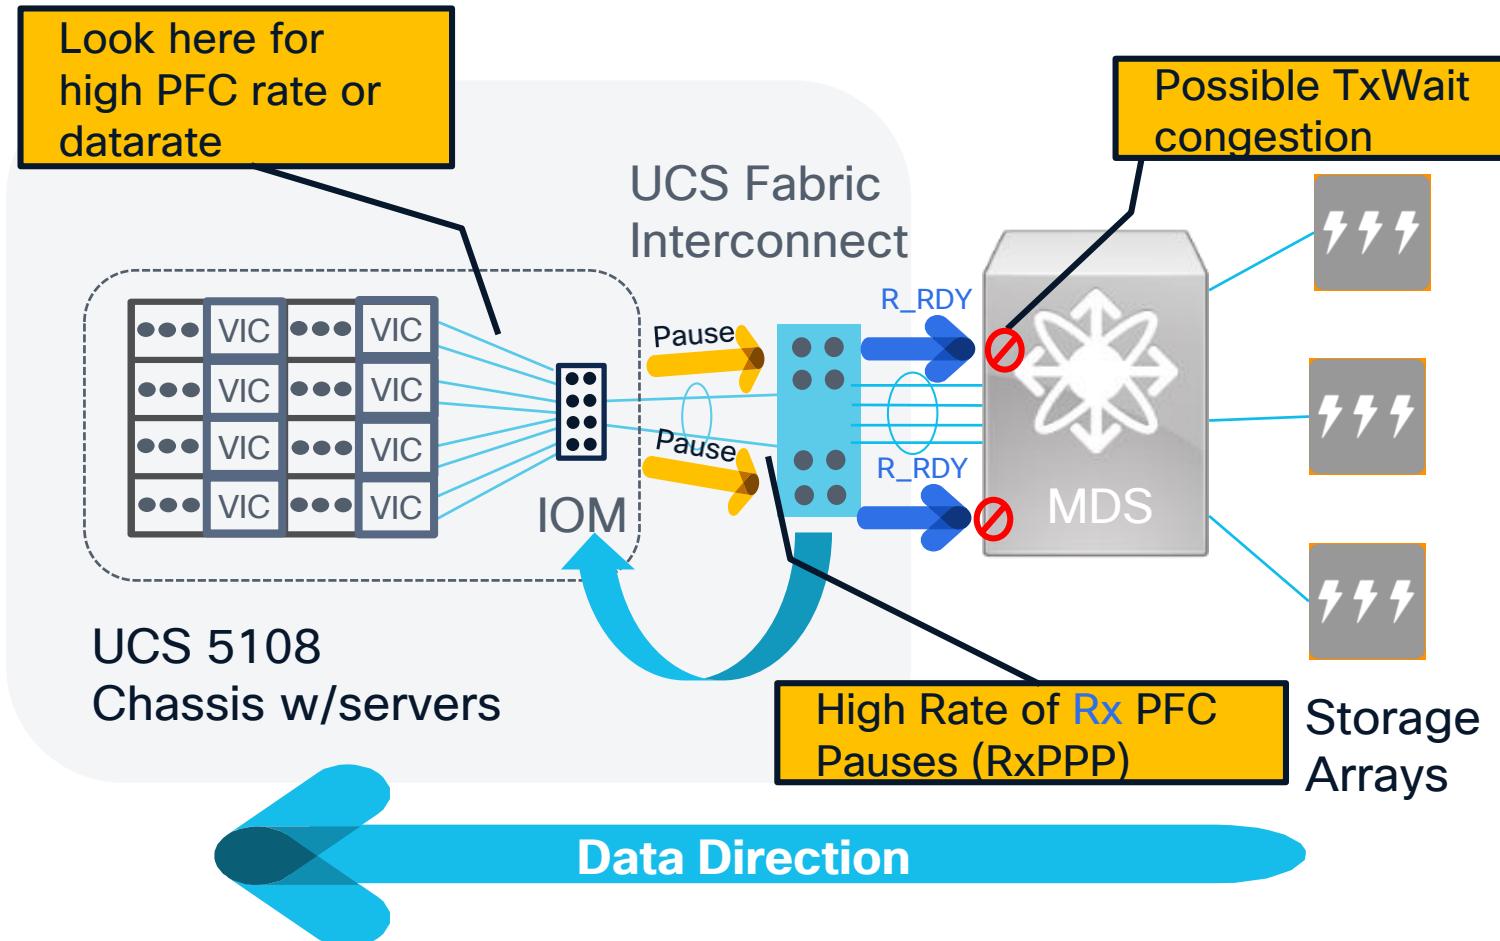

- For Tx congestion (e.g. high Rx PFC rate)
  - Check next hop where the **PFCs Pauses** are being received from

## Follow Rx congestion to the source of the data to find the victim(s)

- For Rx congestion (e.g. high Tx PFC rate)
  - Check next hop where **data** is being received from

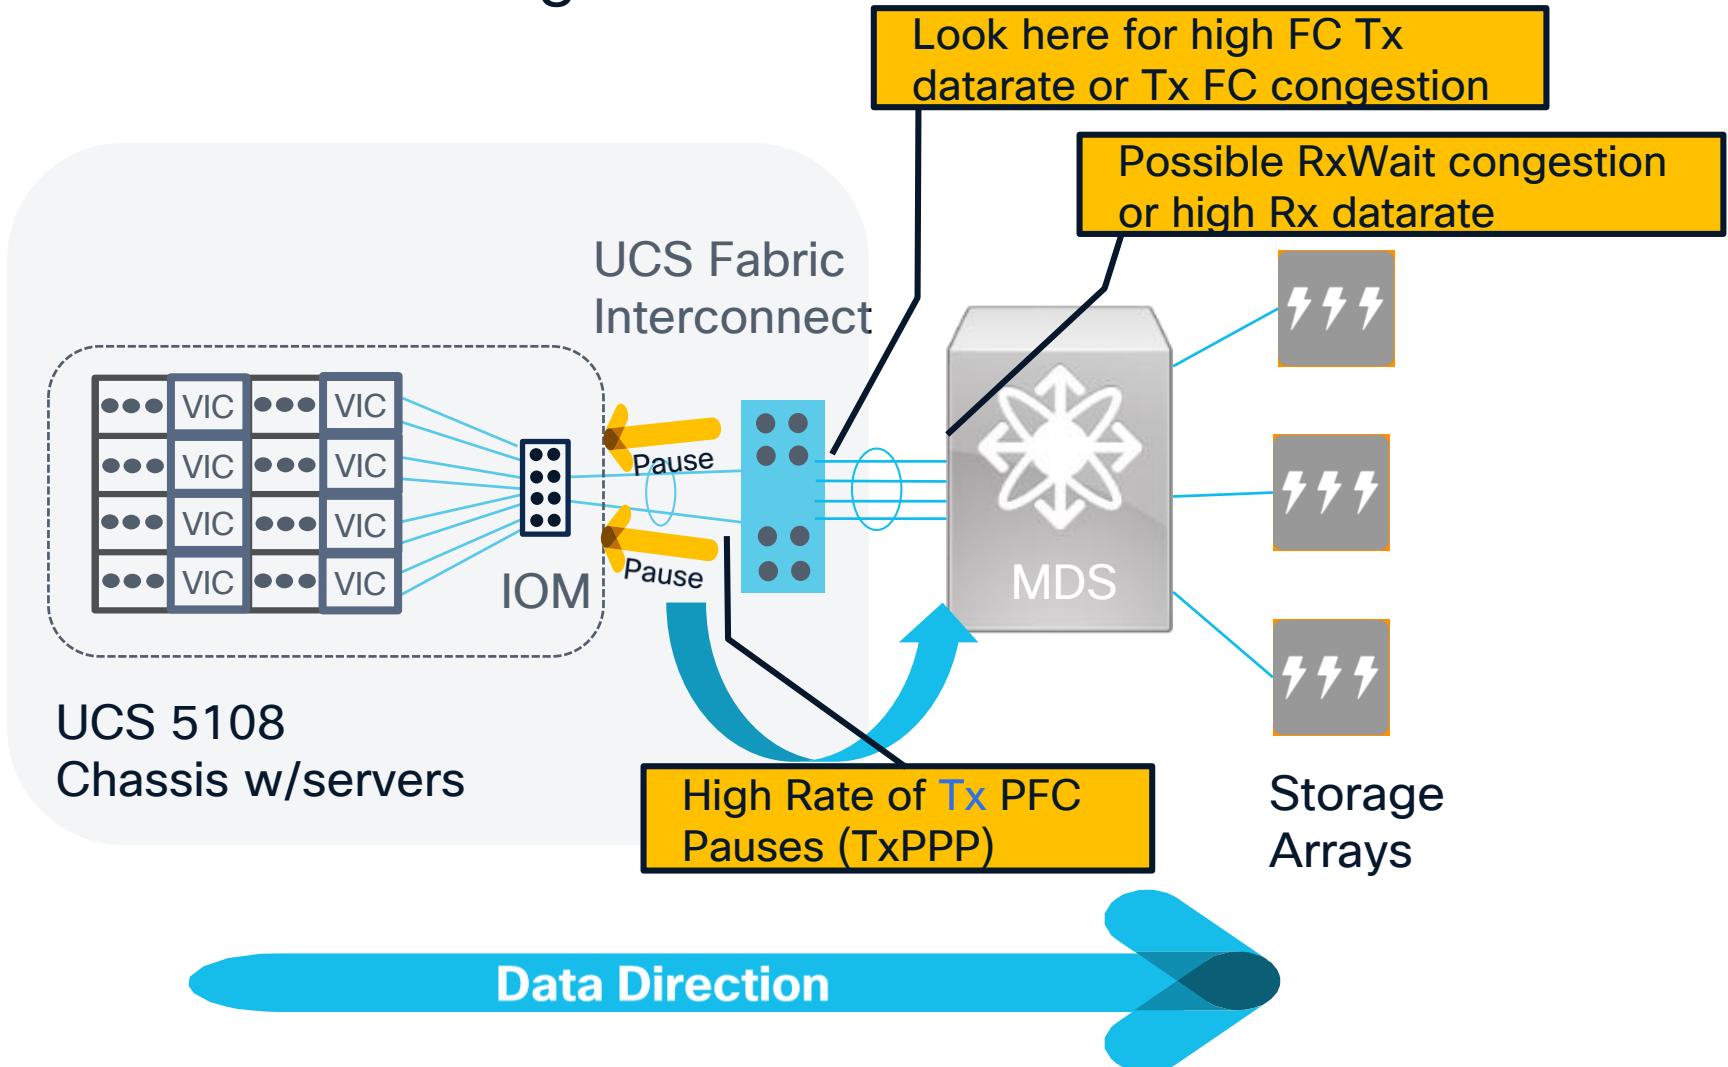

# Tx Congestion

Check next hop where the **PFCs Pauses** are being received from

# Rx Congestion

Check next hop where data is being received from

# Troubleshooting Workflows

## Where to start?

Recommendation is to start in the MDS fabric and look for congestion

- MDS has excellent time and date stamped congestion logs

## 4 possibilities

- Upstream MDS is reporting TxWait congestion on FC uplinks to FI
  - Scenarios 1, 2 and 3
- Upstream MDS is reporting RxWait congestion on FC uplinks to FI
  - Scenarios 4 and 5
- Upstream MDS is reporting high Tx or Rx utilization
  - Scenarios 6 and 7
- Upstream MDS is **not** reporting any congestion
  - Scenarios 8, 9 and 10

# Troubleshooting Workflow 1

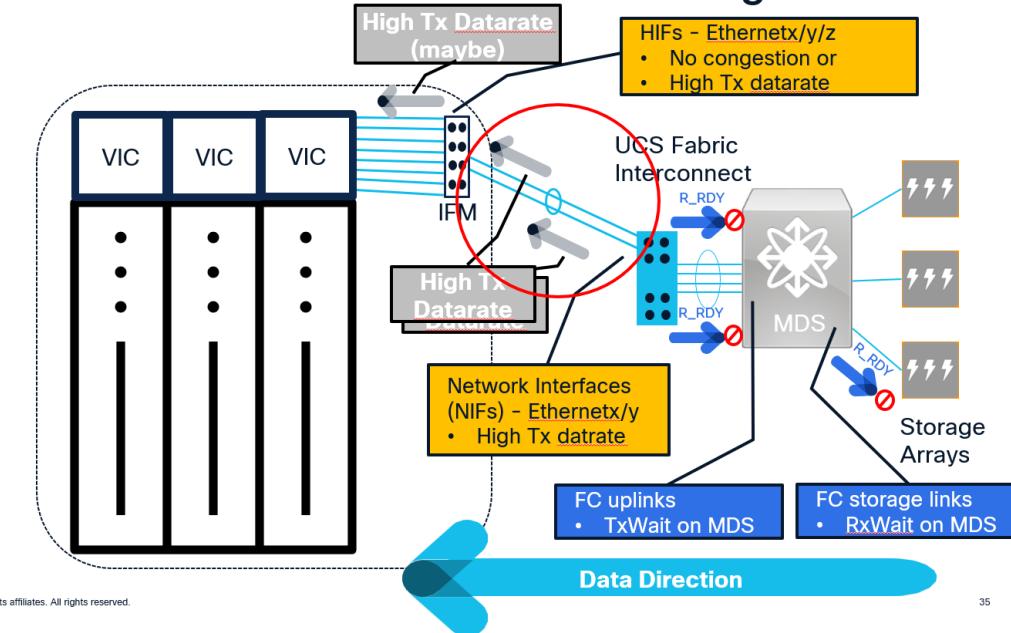

If upstream MDS is reporting TxWait congestion on FC uplinks to UCS FI

## Congestion is within the UCS domain

### Step 1

- Check Tx Over-utilization on Ethernet $x/y$  links to IOM/IFM – Scenario 1
  - If found increase capacity on those links
- Check PFC Pause received(RxPPP) from IOM/IFM on Ethernet $x/y$  links
  - If RxPPP found go to Step 2

### Scenario 1 – FI to NIF Over-Utilization Congestion

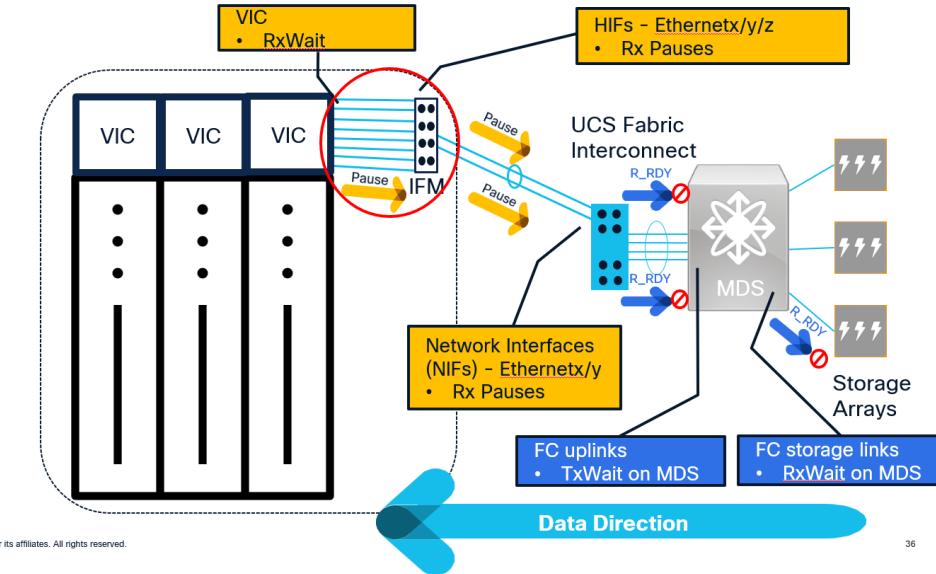

# Troubleshooting Workflow 1 – continued

If upstream MDS is reporting TxWait congestion on FC uplinks to UCS FI

## Step 2

- Check PFC Pause received (RxPPP) from VIC on Ethernetx/y/z links
  - If found check RxWait on VIC on Ethernetx/y/z link – Scenario 2
    - If significant RxWait found investigate individual server for internal bottlenecks
  - If no PFC Pause received (RxPPP) or no RxWait found go to Step 3

### Scenario 2 – VIC to HIF Slow Drain Congestion

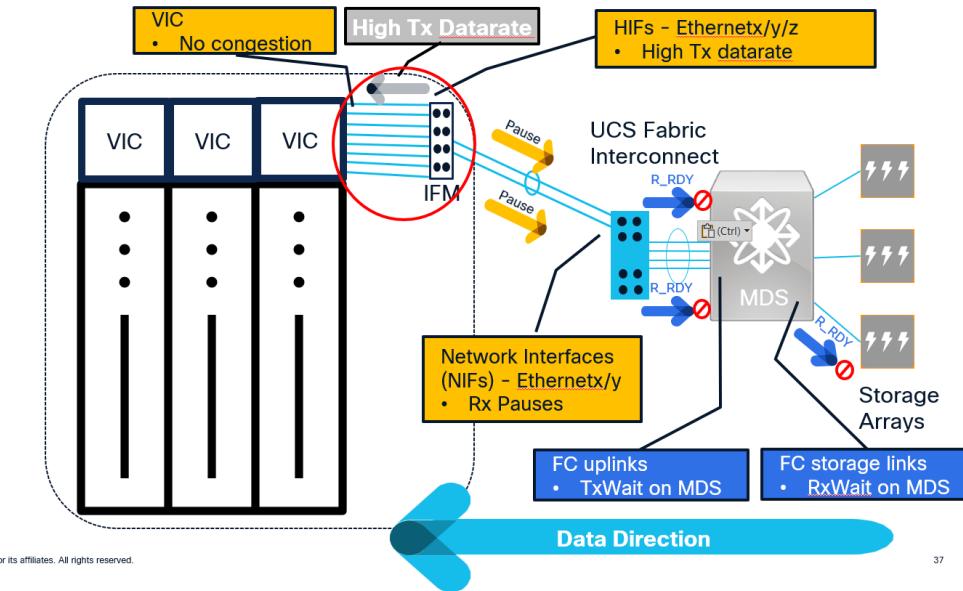

# Troubleshooting Workflow 1 – continued

If upstream MDS is reporting TxWait congestion on FC uplinks to UCS FI

## Step 3

- Check Tx Over-utilization on Ethernet $x/y/z$  links – Scenario 3
  - If found increase capacity from IOM/IFM to VIC
    - Port expander
    - Updated IOM/IFM and VIC

### Scenario 3 – HIF to VIC Over-Utilization Congestion

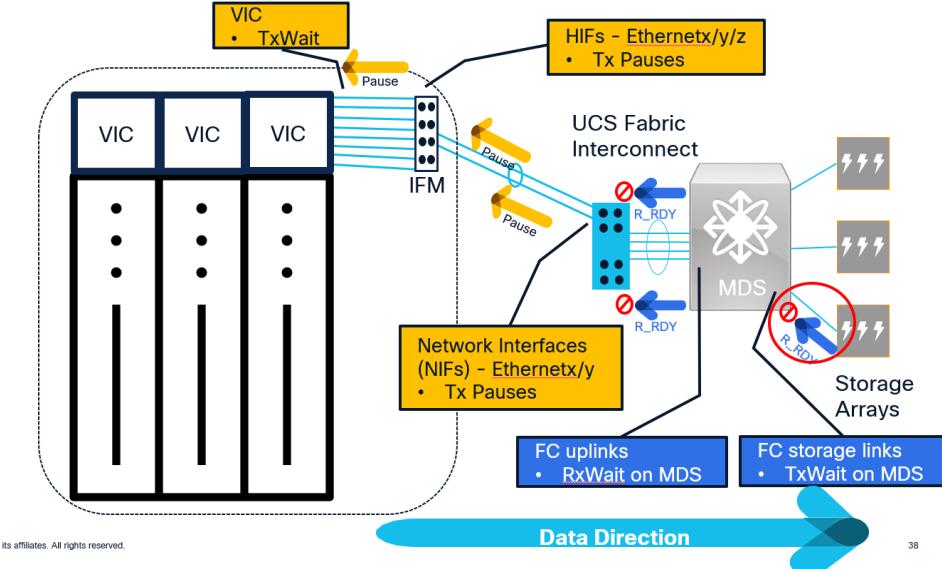

# Troubleshooting Workflow 2

If upstream MDS is reporting RxWait congestion on FC uplinks to UCS FI

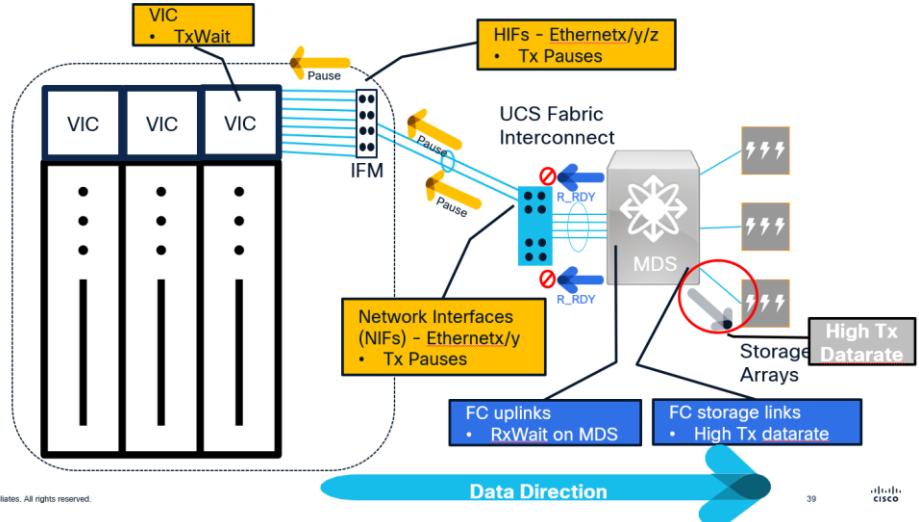

## Congestion is within MDS SAN

- Indications in UCS include
  - PFC Pause transmitted(TxPPP) from FI on Ethernet $x/y$  links
  - PFC Pause transmitted (TxPPP) from IOM/IFM on Ethernet $x/y/z$  links
- Scenarios 4 and 5
- Troubleshoot FC congestion issue (See BRKDCN-2942)

## Scenario 4 - Array Slow Drain Congestion

## Scenario 5 - Array Tx Over-Utilization Congestion

# Troubleshooting Workflow 3

If UCS FI or upstream MDS is reporting high datarate on FC uplinks

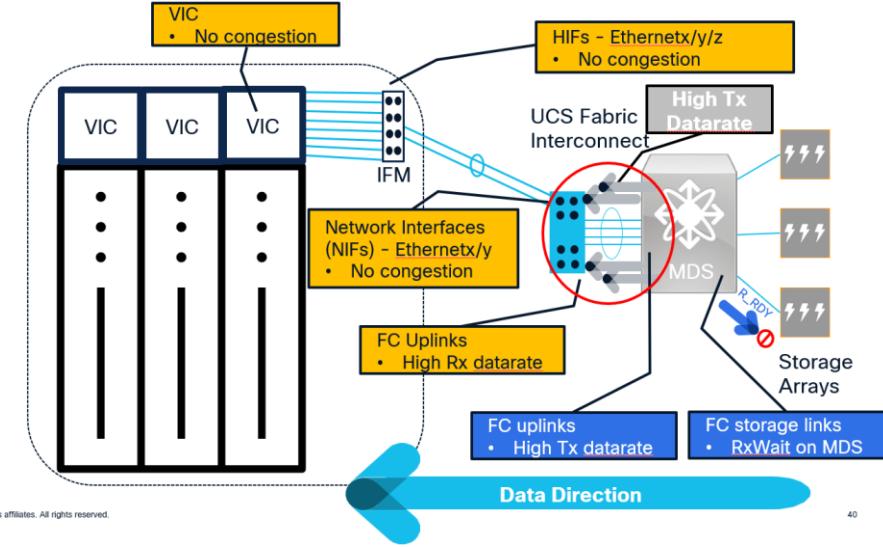

Congestion is due to insufficient FC bandwidth

Scenarios 6 & 7

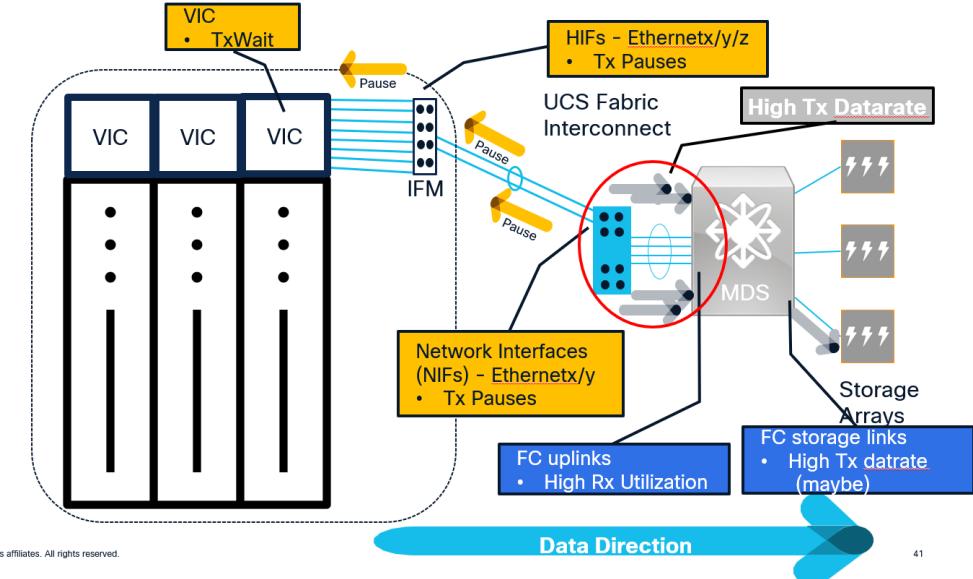

Increase FC link bandwidth via:

- Higher speed links
- More links into port-channels
- Consider splitting port-channel into 2-4 port-channels

## Scenario 6 - FC Uplink Over-Utilization Congestion

## Scenario 7 - FC Uplink Over-Utilization Congestion

# Troubleshooting Workflow 4

If upstream MDS is not reporting any congestion on FC uplinks to UCS FI

Congestion could be within the UCS domain

Congestion could be within MDS SAN

Check links for high Tx/Rx datarate

Scenarios 8, 9 and 10

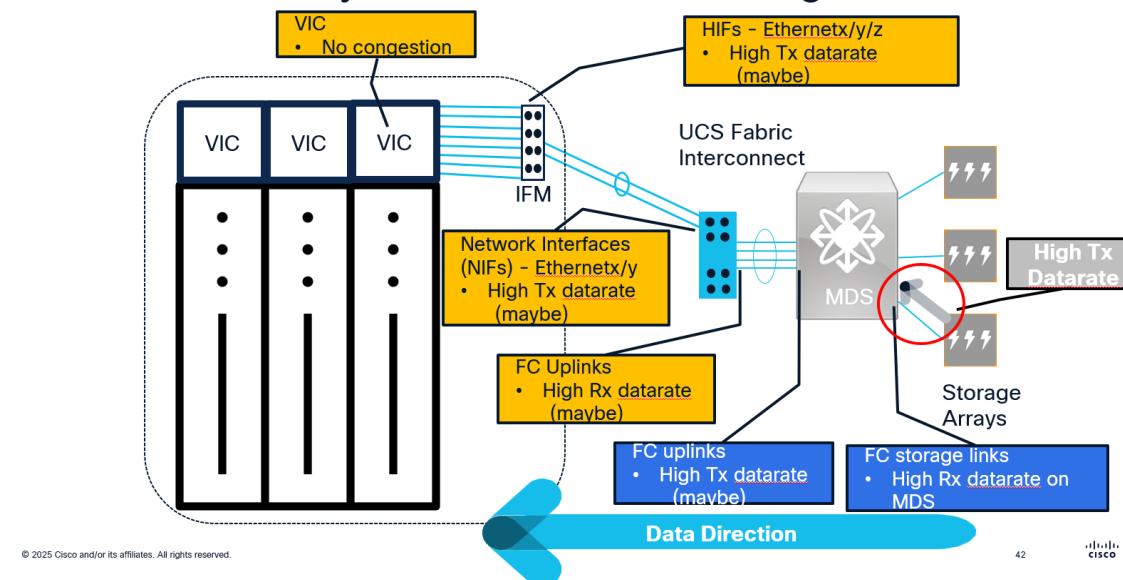

Step 1

Check FC links for high utilization

Scenario 5

If found increase capacity on links

Scenario 8 - Array Rx Over-Utilization Congestion

# Troubleshooting Workflow 4 – continued

If upstream MDS is not reporting any congestion on FC uplinks to UCS FI

## Step 2

Check high Rx utilization on IOM/IFM to FI on Ethernet $x/y$  links (Rx from FI's perspective)

### Scenario 9

- If found there also should be PFC Pause transmitted (TxPPP) from IOM/IFM to VICs on Ethernet $x/y/z$  links
- If found increase bandwidth on IOM/IFM to FI links

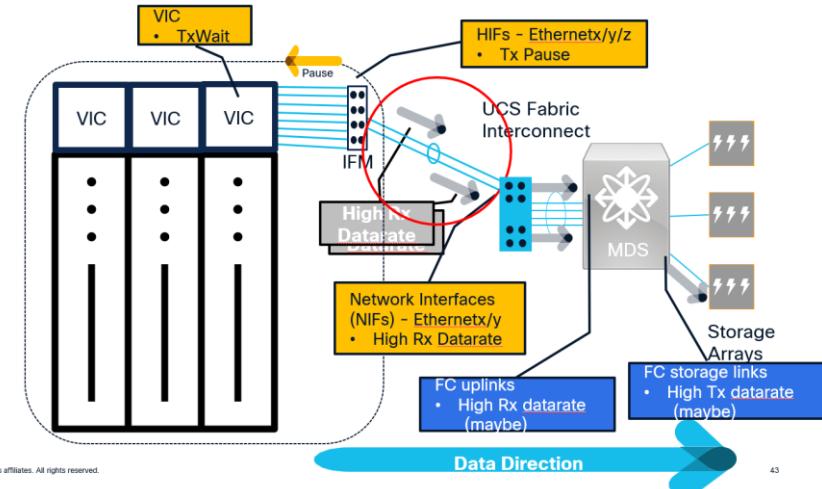

## Step 3

Check high Rx utilization on VIC to IOM/IFM Ethernet $x/y/z$  links (Rx from IOM/IFM's perspective)

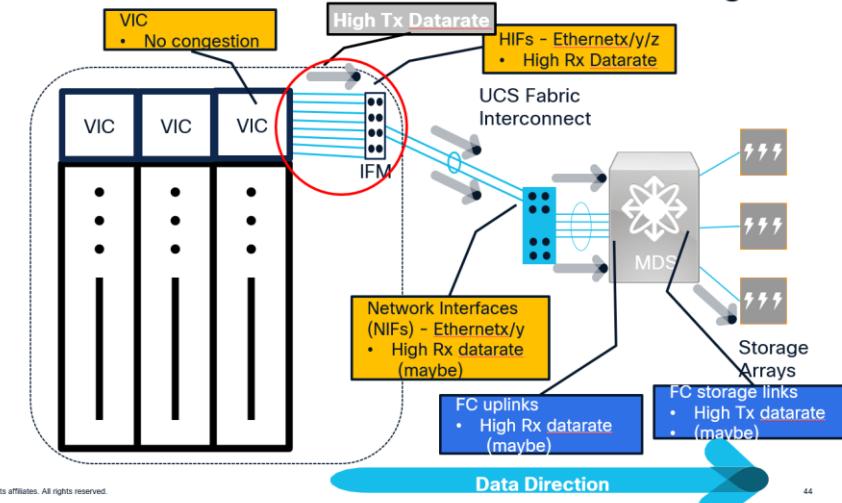

### Scenario 10

- If found increase bandwidth on VIC to IOM/IFM links

#### Scenario 9 - NIF to FI Over-Utilization Congestion

#### Scenario 10 - VIC to HIF link Over-Utilization Congestion

# UCS Congestion Commands

# show interface fc

show interface contains only basic FC info.

```
fc1/1 is trunking
Hardware is Fibre Channel, SFP is short wave laser w/o OFC (SN)
Port WWN is 20:01:00:3a:9c:f2:83:d8
Admin port mode is NP, trunk mode is on
snmp link state traps are enabled
Port mode is TNP
Port vsan is 1
Operating Speed is 32 Gbps
Admin Speed is 32 Gbps
Transmit B2B Credit is 32
Receive B2B Credit is 64
Receive data field Size is 2112
Beacon is turned off
fec state is enabled by default
Belongs to san-port-channel11
Trunk vsans (admin allowed and active) (1,3511)
Trunk vsans (up) (1,3511)
Trunk vsans (isolated) ()
Trunk vsans (initializing) ()
5 minutes input rate 1745371760 bits/sec, 218171470 bytes/sec, 110101 frames/sec
5 minutes output rate 177147816 bits/sec, 22143477 bytes/sec, 14531 frames/sec
1280970913463 frames input, 2428652799045228 bytes
  0 discards, 0 errors
  0 invalid CRC/FCS, 0 unknown class
  0 too long, 0 too short
473576843374 frames output, 821659884226636 bytes
  0 discards, 0 errors
  2 input OLS, 35 LRR, 2 NOS, 0 loop inits
  9 output OLS, 4 LRR, 2 NOS, 0 loop inits
Receive B2B Credit performance buffers is 0
32 transmit B2B credit remaining
  0 low priority transmit B2B credit remaining
Last clearing of "show interface" counters :never
```

Tx/Rx Credits  
agreed to

Tx Credits remaining (real time)

# show interface priority-flow-control

`show interface priority-flow-control` displays the total PFC pauses from the FI's perspective

Ethernetx/y links are links to IOM/IFMs

```
show interface priority-flow-control
```

```
slot 1
```

```
=====
```

Port	Mode	Oper (VL bmap)	RxPPP	TxPPP
...				
Ethernet1/17	On	On (8)	49230	0
Ethernet1/18	On	On (8)	48042	0
Ethernet1/19	On	On (8)	51126	0

Ethernet4/1/30	Auto	Off	0	0
Ethernet4/1/31	Auto	On (8)	6642	0
Ethernet4/1/32	Auto	Off	0	0
Ethernet4/1/33	Auto	Off	0	0

Ethernet1/x/y are links to chassis 1

Ethernet4/x/y are links to chassis 4

...etc...

- Mode – PFC mode – Should be on or Auto
- Oper – Should be On
- VL Bmap – Indicates classes using PFC
  - 8 is class 3
  - Might be two classes if RoCE
- RxPPP – Count of Received Per Priority Pause(PFC) **by HIF on IOM/IFM**
- TxPPP – Count of Transmitted Per Priority Pause(PFC) **by HIF on IOM/IFM**
- Can be cleared using ‘clear qos statistics’

# show fex detail

- **show fex detail shows which Ethernetx/y links go to which chassis**
- **Ethernetx/y/ links are links from the server VICs to IOM/IFMs**

```
show fex detail
FEX: 1 Description: FEX0001      state: Online
      FEX version: 9.3(5)I43(5a) [Switch version: 9.3(5)I43(5a) ]
...
Fabric interface state:
  Po1025 - Interface Up. State: Active
  Eth1/17 - Interface Up. State: Active
  Eth1/18 - Interface Up. State: Active
  Eth1/19 - Interface Up. State: Active
  Eth1/20 - Interface Up. State: Active
```

These 4 Ethernet interfaces connect to chassis 1 (FEX/IOM/IFM 1) via a 4 member port-channel1025

# Datarate and PFC rate monitoring

- 4.3(4a) introduced:
  - `show logging onboard fc-datarate`
  - `show logging onboard datarate`
  - `show logging onboard pfc`
  - Applies to 4G and 5G Fis (6454, 64108, 6536, etc.)
- 4.3(6a) introduced:
  - `show logging onboard datarate fex <x>`
  - `show logging onboard pfc fex <xx>`
  - Applies to 2408 IOMs and 9108 IFMs
- Thresholds
  - Datarate
    - Datarate rising-threshold logged when 10 second average  $\geq$  80%
    - Datarate falling-threshold logged when 10 second average  $\leq$  70%
  - PFC
    - PFC Thresholds(PFC per second): 10G - 300, 25G - 750, 40G - 1200, 100G - 3000
    - PFC Rising threshold: 30% (e.g. 90 PFC/sec @ 10G)
    - PFC Falling threshold: 10% (e.g. 30 PFC/sec @ 10G)

# FC uplink datarate monitoring

4.3(4a)

## show logging onboard fc-datarate

- Shows high Tx and Rx datarate on the upstream FC links to MDS
- Average over 10 seconds

```
(nx-os) # show logging onboard fc-datarate

# Ethernet datarate monitoring on IOM/IFM HIF Ports

4.3(6a)

## show logging onboard datarate fex 3

- Shows high Tx and Rx datarate on Ethernetx/y/z links on links from the IOM/IFM to VIC
- Average over 10 seconds
- Applies to 24xx IOMs and 91xx IFMs

```
(nx-os)# show logging onboard datarate fex 3

slot 1
=====

Notes:
Switch OBFL Log: Enabled

Notes:
- Datarate Sampling Interval: 10 seconds
- Datarate Rising threshold: 80%
- Datarate Falling threshold: 70%
=====
Date and Time          : Interface      : Speed   : Direction : Counter      : Gb per Sec   : Link Utilization : Rising/Falling Thresholds

# VIC Txwait and Rxwait

VICs measure time paused in each direction

4.3(4a)

- Shows TxWait and RxWait from VIC's perspective

```
adapter (macd):3# waitstats 0

PFC priorities active: 3

1 MIN DELTA TOTAL DESCRIPTION
0 1 RxWait Pri#3 2.5us Count
0 9462815 TxWait Pri#3 2.5us Count
Percentage RxWait for Pri#3 for last 5s/1m/1h/72h: 0%/0%/0%/0%
Percentage TxWait for Pri#3 for last 5s/1m/1h/72h: 0%/0%/0%/0%

adapter (macd):6# waitstatshistory
236 events from last boot, showing last 236, maximum 1024
Notes:
- Sampling period is 20 seconds
- Only wait delta >= 100 ms are logged
-----
| Interface | Priority | Delta Wait Time | Congestion | Timestamp
|           |          | 2.5us ticks | seconds | |
-----
| port 2   | TxPri#3 | 122636 | 0 | 1% | 250506-22:51:58
| port 0   | TxPri#3 | 119860 | 0 | 1% | 250506-22:51:58
| port 2   | TxPri#3 | 87142 | 0 | 1% | 250506-22:51:38
| port 0   | TxPri#3 | 77988 | 0 | 0% | 250506-22:51:38
| port 2   | TxPri#3 | 77442 | 0 | 0% | 250506-22:51:18
```

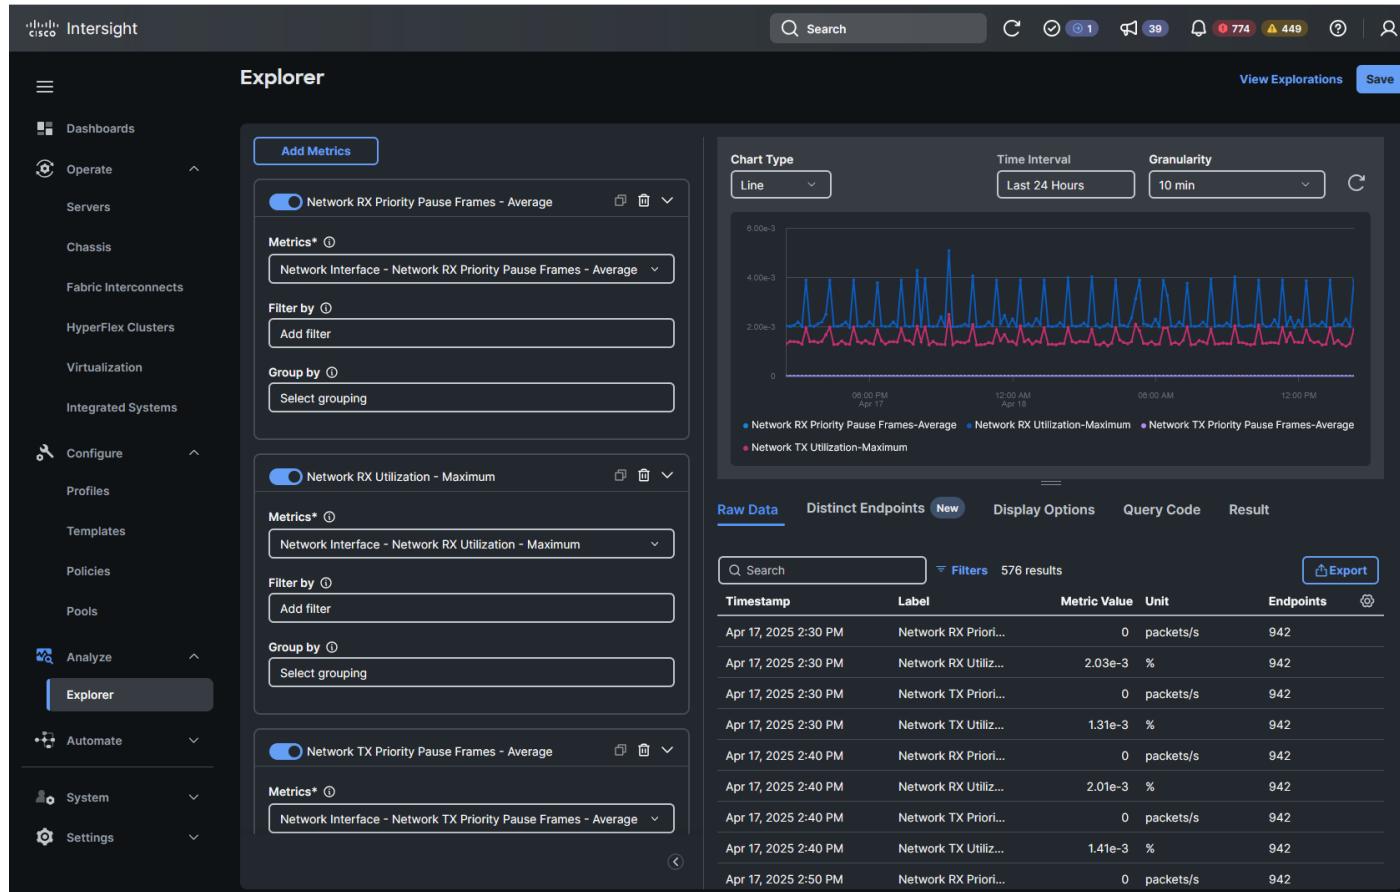

VIC logs with Tx/RxWait are included in

- UCS Chassis bundle
- IMM CIMC Bundle

Steps to issue VIC commands

- ssh to FI
- connect adapter 3/3/1
- attach-mcp
- vnic
- attach-macd

# Intersight Metrics Explorer

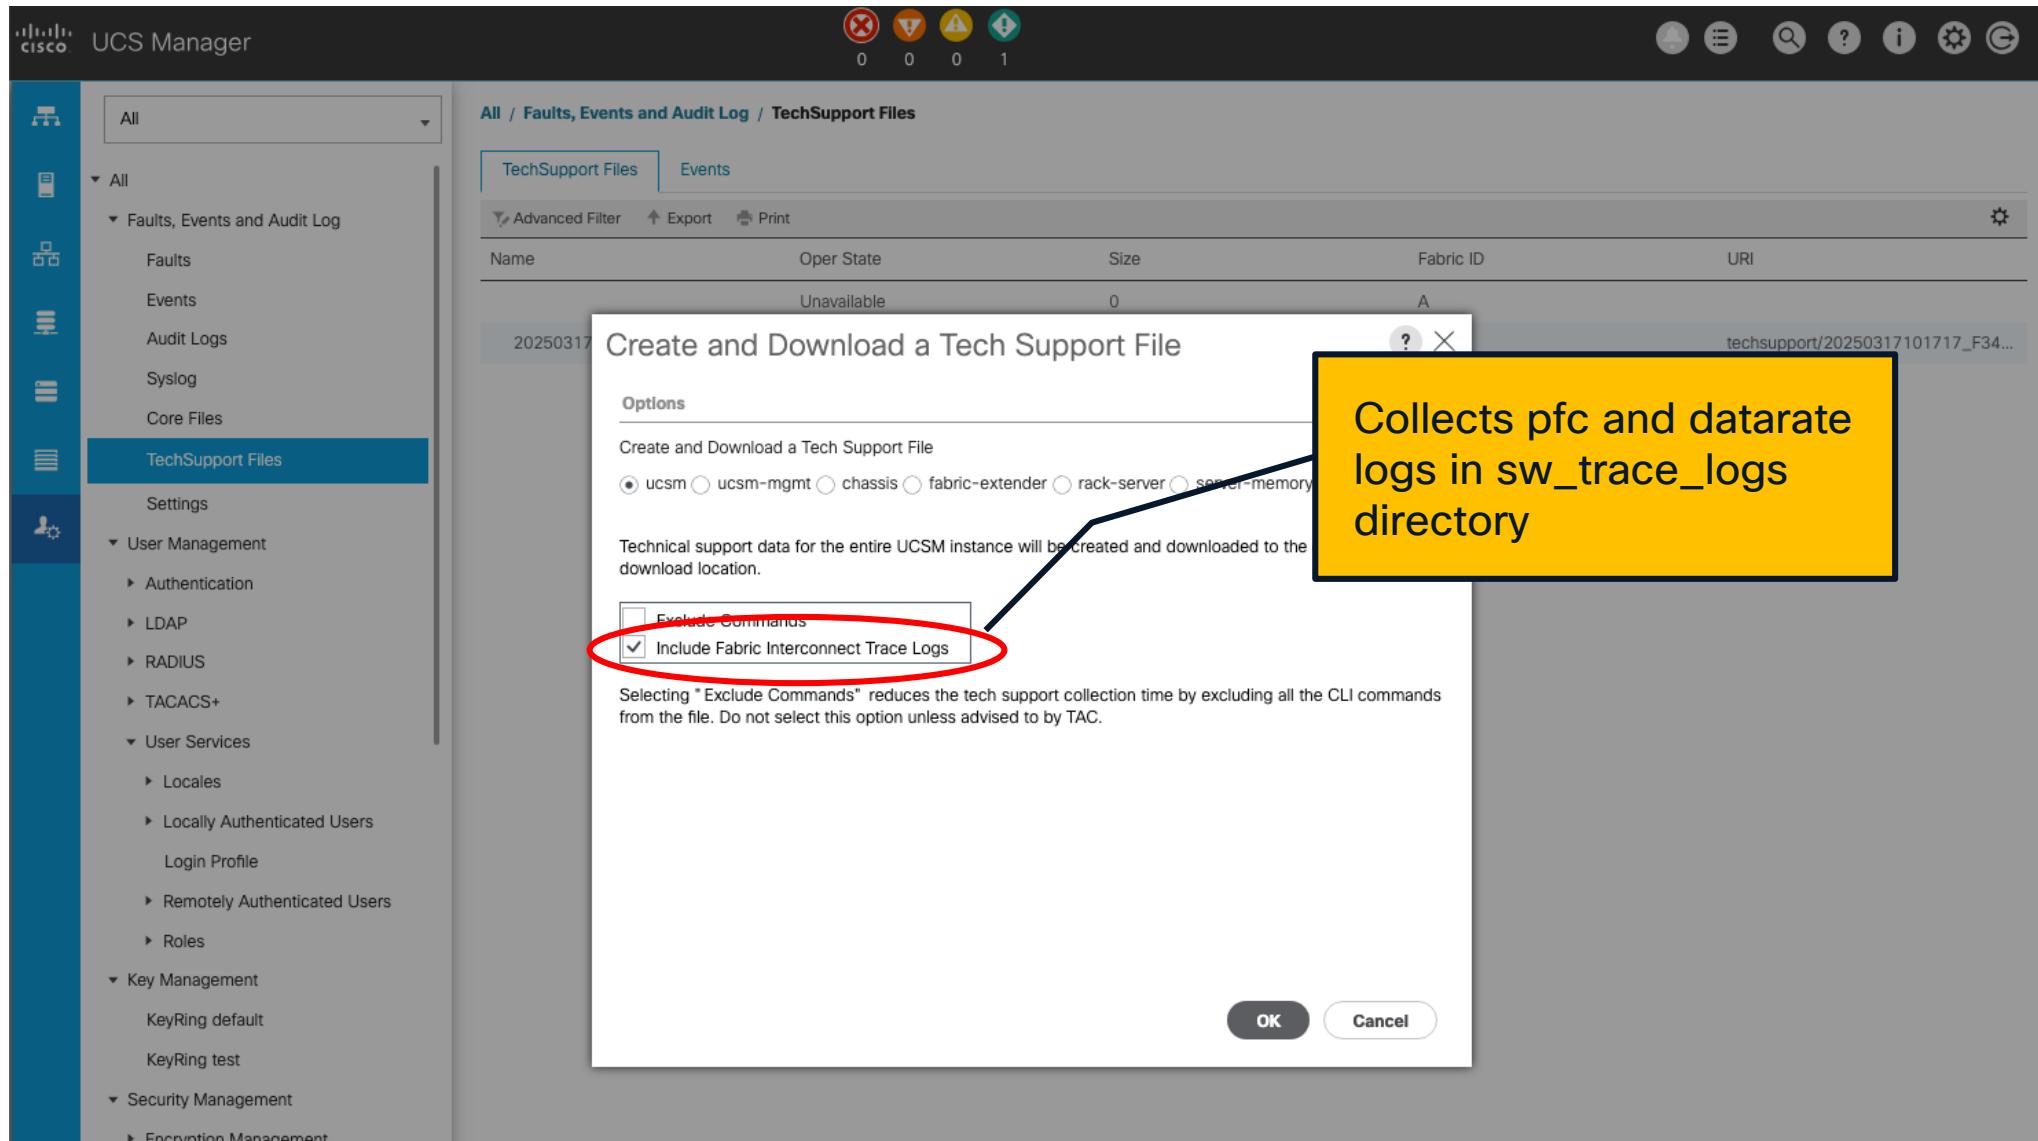

Intersight allows the graphing of various metrics.

Several metrics are there for congestion:

- Network RX Priority Pause Frames
- Network TX Priority Pause Frames
- Network RX Utilization
- Network TX Utilization

# UCS Techsupport Commands

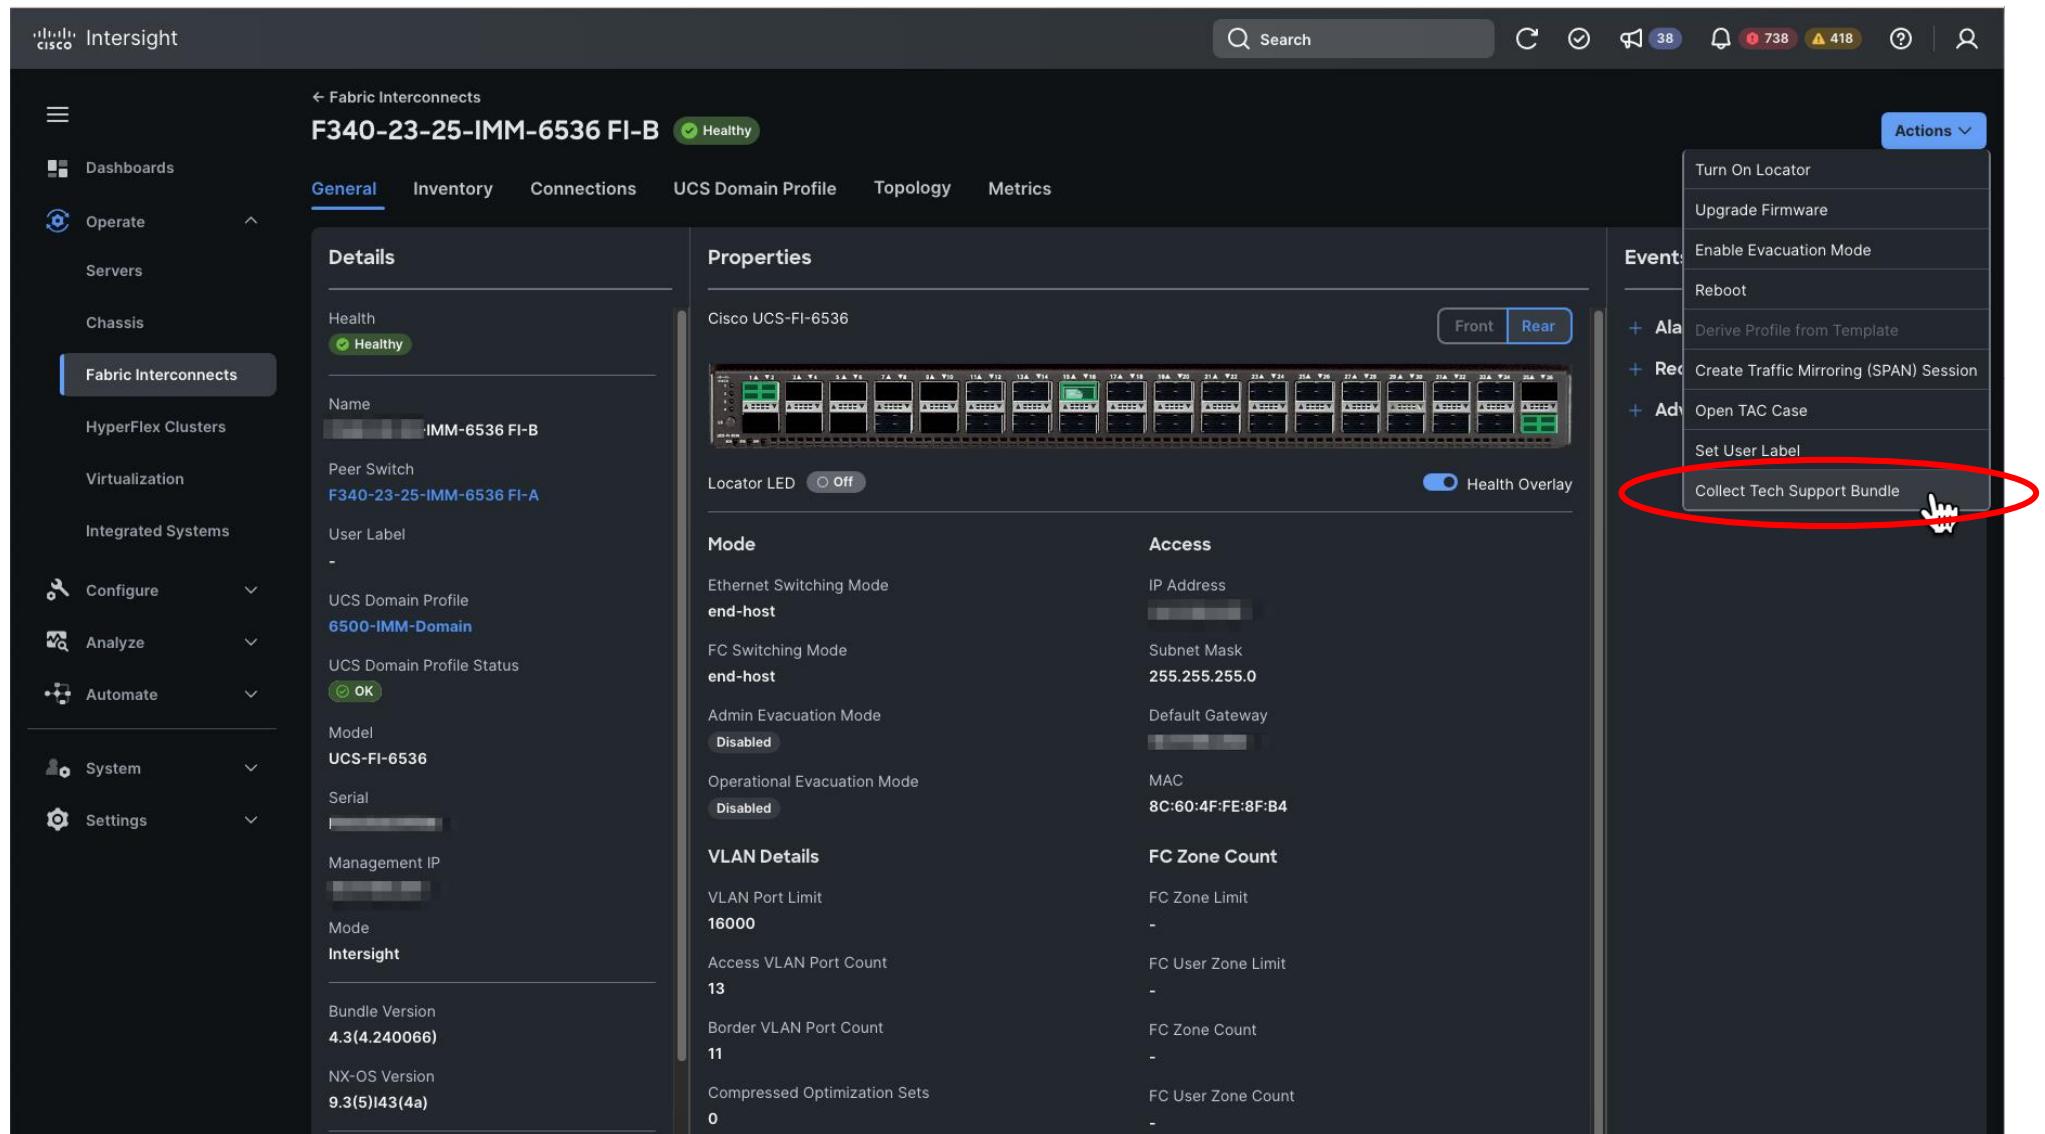

# UCSM techsupport Include trace logs

The screenshot shows the UCS Manager interface with the following details:

- UCS Manager Header:** Shows 0 faults, 0 events, 0 audit logs, and 1 trace log.
- Left Sidebar:** Navigation menu with categories like All, Faults, Events, Audit Logs, Syslog, Core Files, and **TechSupport Files** (which is selected).
- Current View:** All / Faults, Events and Audit Log / TechSupport Files. The **TechSupport Files** tab is selected.
- Modal Dialog:** "Create and Download a Tech Support File" dialog. It includes:
  - Options:** A list of components to include in the support file (ucsm, ucsm-mgmt, chassis, fabric-extender, rack-server, server-memory). The "ucsm" option is selected.
  - Text:** "Technical support data for the entire UCSM instance will be created and downloaded to the download location."
  - Checkboxes:**  Exclude Commands (unchecked) and  Include Fabric Interconnect Trace Logs (checked). The "Include Fabric Interconnect Trace Logs" checkbox is highlighted with a red circle.
  - Text:** "Selecting 'Exclude Commands' reduces the tech support collection time by excluding all the CLI commands from the file. Do not select this option unless advised to by TAC."
  - Buttons:** OK and Cancel.
- Yellow Callout:** A yellow box with a black border and text: "Collects pfc and datarate logs in sw\_trace\_logs directory". A black arrow points from this box to the "Include Fabric Interconnect Trace Logs" checkbox in the dialog.

# IMM Techsupport

The screenshot shows the Cisco Intersight web interface for managing a Cisco UCS FI-6536 FI-B chassis. The main view displays the chassis's general properties, including its model (Cisco UCS FI-6536), switching mode (Ethernet and FC), and various connection and access details. The 'Actions' menu on the right provides several options for managing the chassis, with the 'Collect Tech Support Bundle' option highlighted by a red circle.

**Actions**

- Turn On Locator
- Upgrade Firmware
- Enable Evacuation Mode
- Reboot
- + Alert
- + Recreate
- + Advance
- Derive Profile from Template
- Create Traffic Mirroring (SPAN) Session
- Open TAC Case
- Set User Label
- Collect Tech Support Bundle** (highlighted with a red circle)

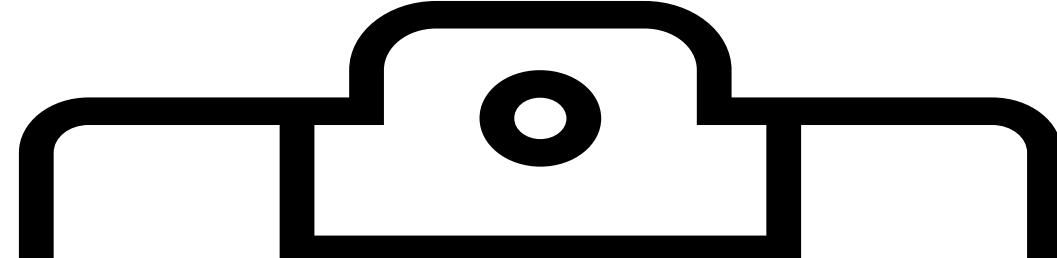

# UCSM Techsupport

- The UCSM Techsupport bundle contains:
- Techsupports for both Fis A & B
  - `sw_techsupportinfo` - contains:
    - `show interface priority-flow-control`
    - `show fex detail`
    - `show logging onboard fc-datarate`
  - `sw_trace_logs` directory - contains:
    - `datamon.log` - `show logging onboard datarate` - Most recent entries
    - `datamon_0.log` - `show logging onboard datarate` - Older entries
    - `pfcmon.log` - `show logging onboard pfc` - Most current entries
    - `pfcmon_0.log` - `show logging onboard pfc` - Older entries
    - `datamon_fexXXX.log` - `show logging onboard datarate fex X` - Most recent entries
    - `datamon_fexXXX_0.log` - `show logging onboard datarate fex X` - Older entries
    - `pfcmon_fexXXX.log` - `show logging onboard pfc fex X` - Most recent entries
    - `pfcmon_fexXXX_0.log` - `show logging onboard pfc fex X` - Older entries

# Conclusion

# Conclusion

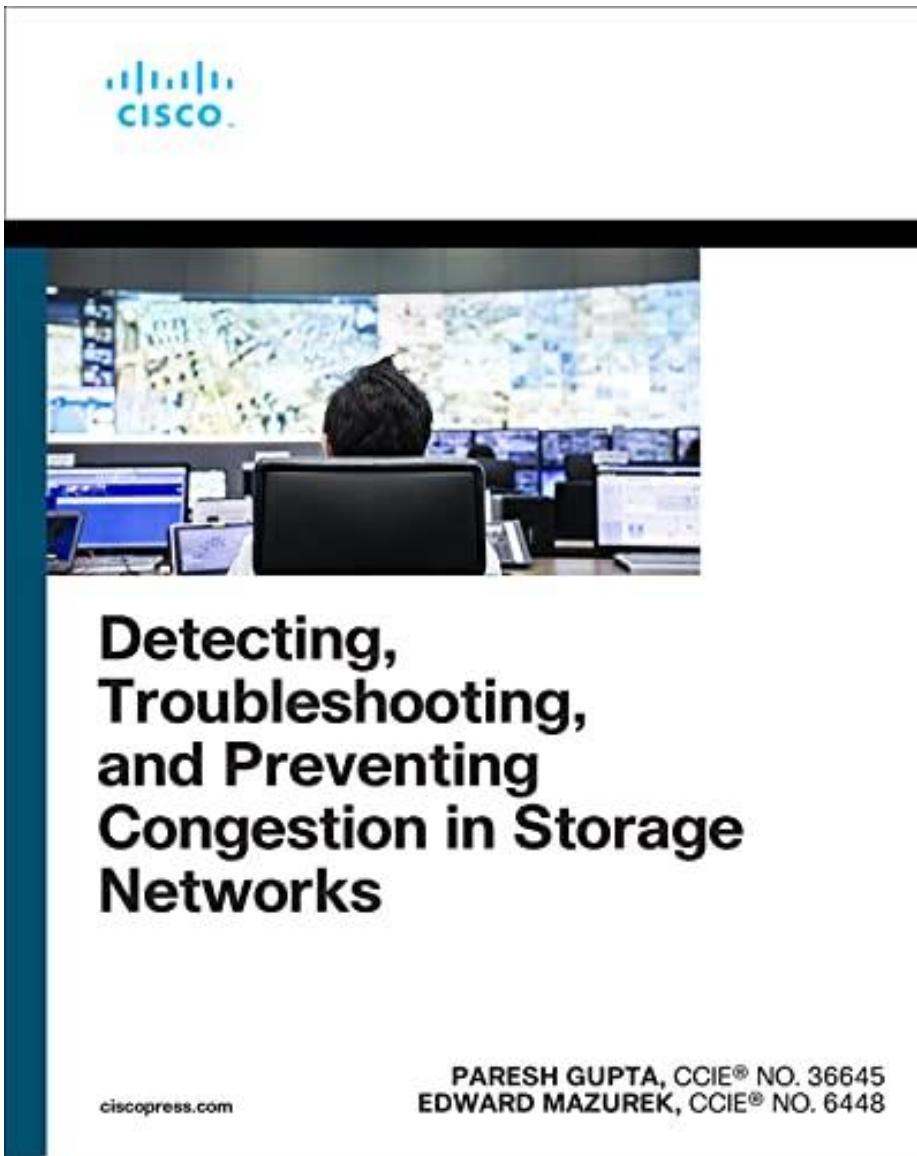

- Troubleshooting congestion within the UCS domain should no longer be a mystery.
- Ensure the UCS domain is at 4.3(6a) or later for the latest enhancements
- Follow troubleshooting workflows to determine congestion type and location
- If problem is determined to be slow drain at a server, then the server and applications must be investigated
- If problem is over-utilization, then the bottleneck connection should have its bandwidth increased
- More features are coming soon to make the data more accessible!

## Agenda

- 01 The UCS Congestion Problem
- 02 UCS Domain Logical Network Layout
- 03 Flow Control Mechanisms
- 04 TxWait and RxWait
- 05 Congestion Types
- 06 UCS Congestion Points
- 07 Troubleshooting Workflows
- 08 UCS Congestion Commands
- 09 UCS Techsupport Commands
- 10 Conclusion

BRKDCN-2942 – SAN Congestion Management and SAN Analytics – Thursday June 12th 10:30 AM

- On Demand Library

BRKDCN-2648 – What's New in NX-OS 8.x and 9.x for MDS and Nexus 9000 for SAN

BRKDCN-3002 – Dynamic Ingress Rate Limiting as a Real Solution to SAN Congestion

BRKDCN-3645 – SAN Insights-Real-time and Always-On NVMe Visibility at Scale

BRKDCN-3641 – Manage, Operate, and Optimize High-Performance Storage Area Networks

# Complete Your Session Evaluations

**Complete** a minimum of 4 session surveys and the Overall Event Survey to be entered in a drawing to win 1 of 5 full conference passes to Cisco Live 2026.

**Earn** 100 points per survey completed and compete on the Cisco Live Challenge leaderboard.

**Level up** and earn exclusive prizes!

**Complete your surveys** in the Cisco Live mobile app.

# Continue your education

**Visit** the Cisco Showcase for related demos

**Book** your one-on-one Meet the Engineer meeting

**Attend** the interactive education with DevNet, Capture the Flag, and Walk-in Labs

**Visit** the On-Demand Library for more sessions at [www.CiscoLive.com/on-demand](http://www.CiscoLive.com/on-demand)

Contact me at: [emazurek@cisco.com](mailto:emazurek@cisco.com)

Thank you
