CISCO Live !

Agenda

- 01 Misconfiguration Consequences
- 02 Intro to Atomic Config Replace (ACR)
- 03 ACR Demos
- 04 NETCONF CLI RPC
- 05 Hands-On Opportunities
- 06 Resources

Cisco Webex App

Questions?

Use Cisco Webex App to chat with the speaker after the session

How

- 1 Find this session in the Cisco Live Mobile App
- 2 Click “Join the Discussion”
- 3 Install the Webex App or go directly to the Webex space
- 4 Enter messages/questions in the Webex space

Webex spaces will be moderated by the speaker until June 13, 2025.

Misconfiguration Consequences

**NETWORK
OUTAGE**

**SECURITY
BREACH**

Human Error or Misconfiguration

NETWORK
OUTAGE

SECURITY
BREACH

State of Network Misconfigurations

45%

Network-related outages are caused by configuration failure. [1]

22%

Data breaches are caused by human errors. [2]

\$1 Million

25% respondents said their most recent outage cost more than \$1 million. [1]

\$4.8 Million

Is the global average cost of a data breach, increased by 10% compared to the previous year. [2]

[1] - Annual outages analysis 2023 - Uptime

[2] - Cost of a Data Breach Report 2024 - IBM

Business Impact of Misconfiguration

\$60 Million

A fast-food chain lost over \$60 million in revenue due to a global IT outage caused by misconfiguration.

\$350 Million

Multinational telecom company lost over \$350 million in revenue due to network-wide outage caused by a config error.

**What problems do you face
during device config?**

Why It's Time for a Change?

The Complexity and Struggles of CLI-Based Automation

Creating
Configurations That
Just Work

Error Handling &
Rollback

Scalability & Operational
Efficiency

Why It's Time for a Change?

Creating Configurations That Just Work

1. Declarative Config Management

Terraform

2. Two-Phase Commit

Verify before apply

Error Handling & Rollback

1. Atomic Config Replace

Transactional Config Change

2. Multiple Rollback Options

Instant Rollback
Post Deployment Rollback

Scalability & Operational Efficiency

1. Programmable Interfaces

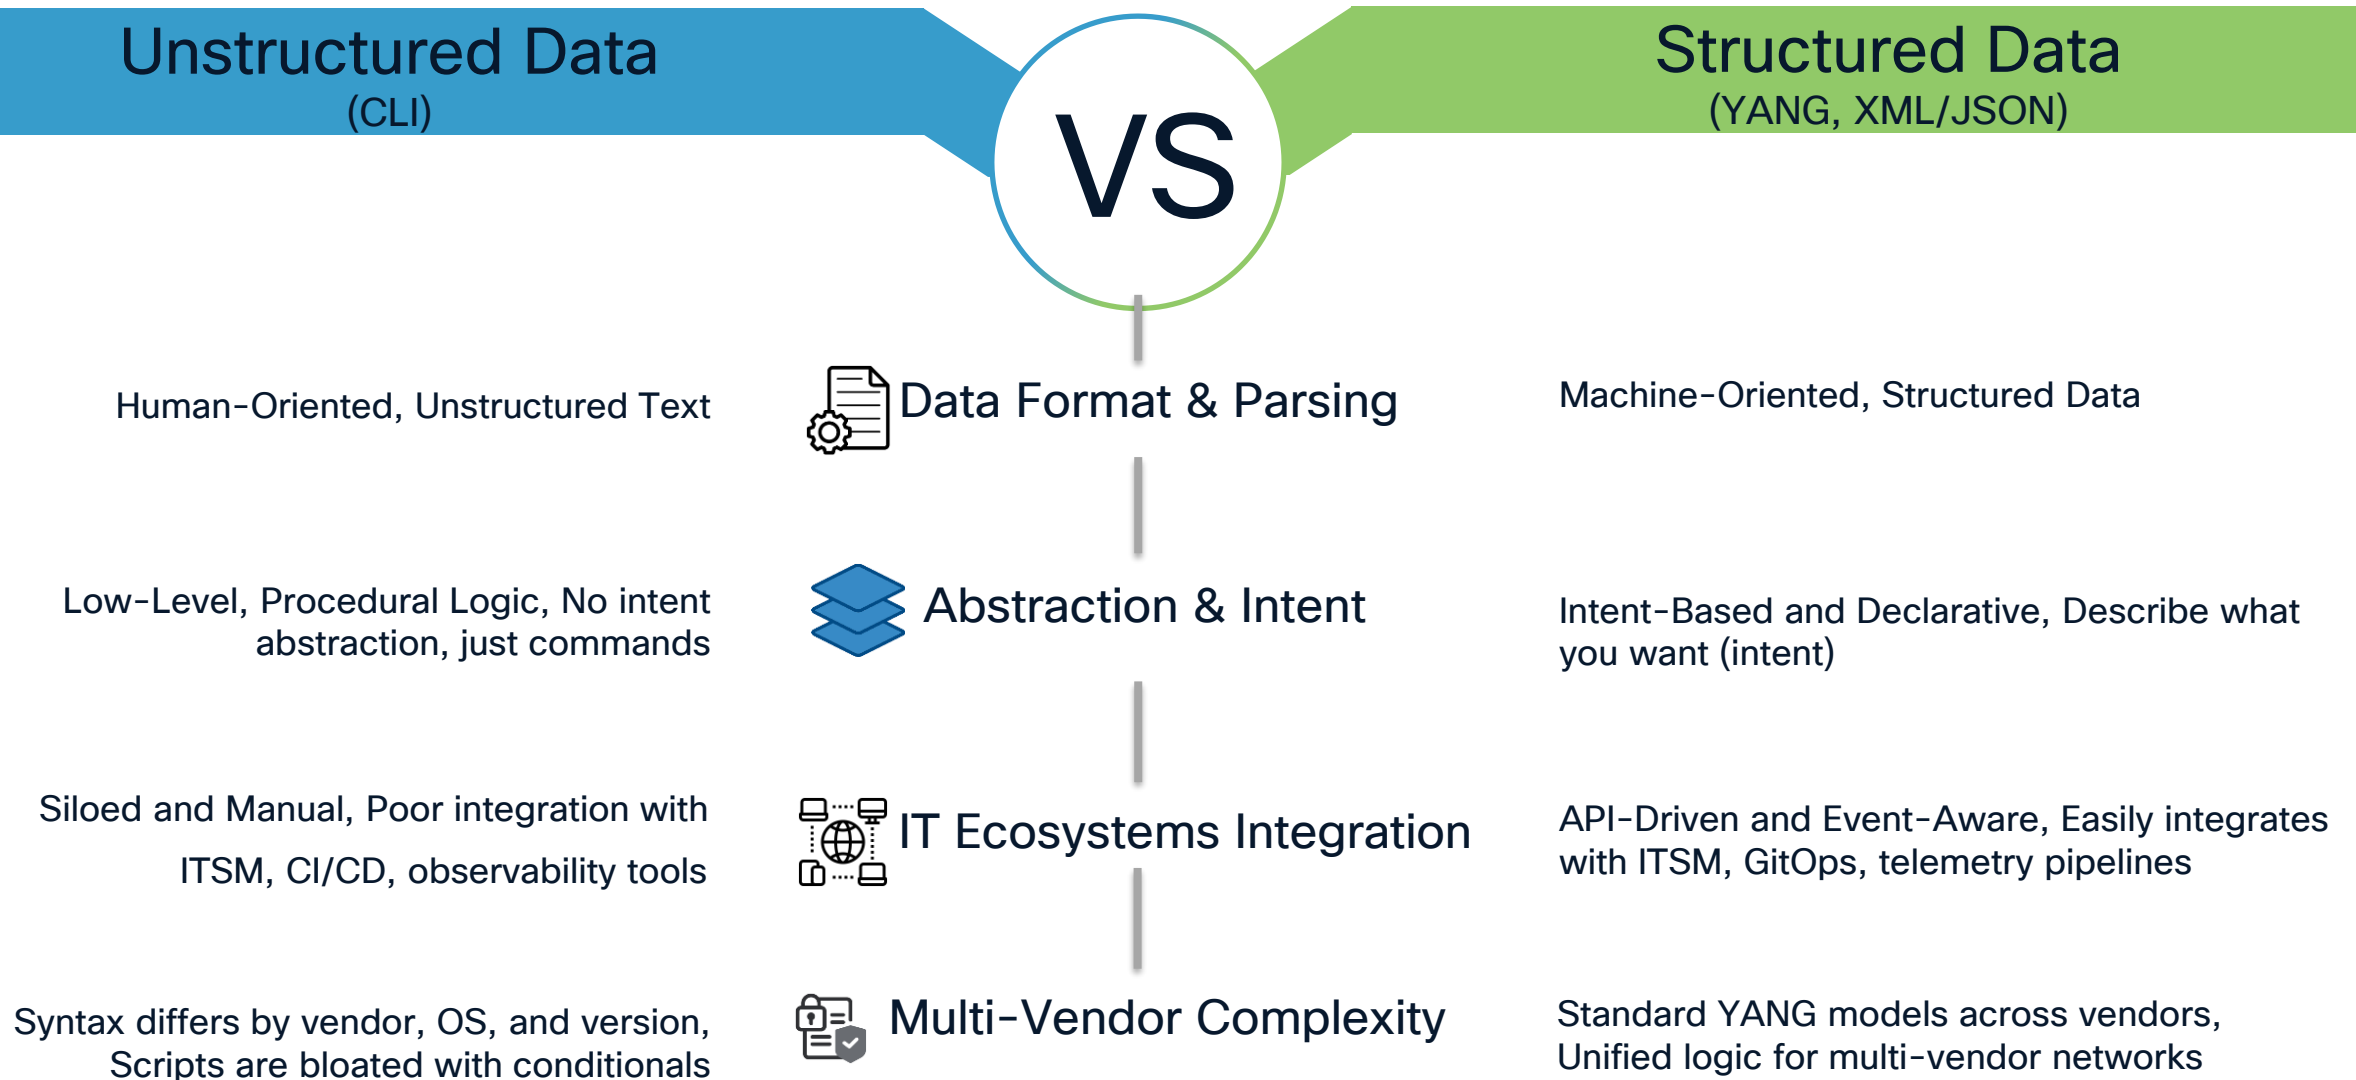

APIs & Yang Models

2. Infrastructure as Code

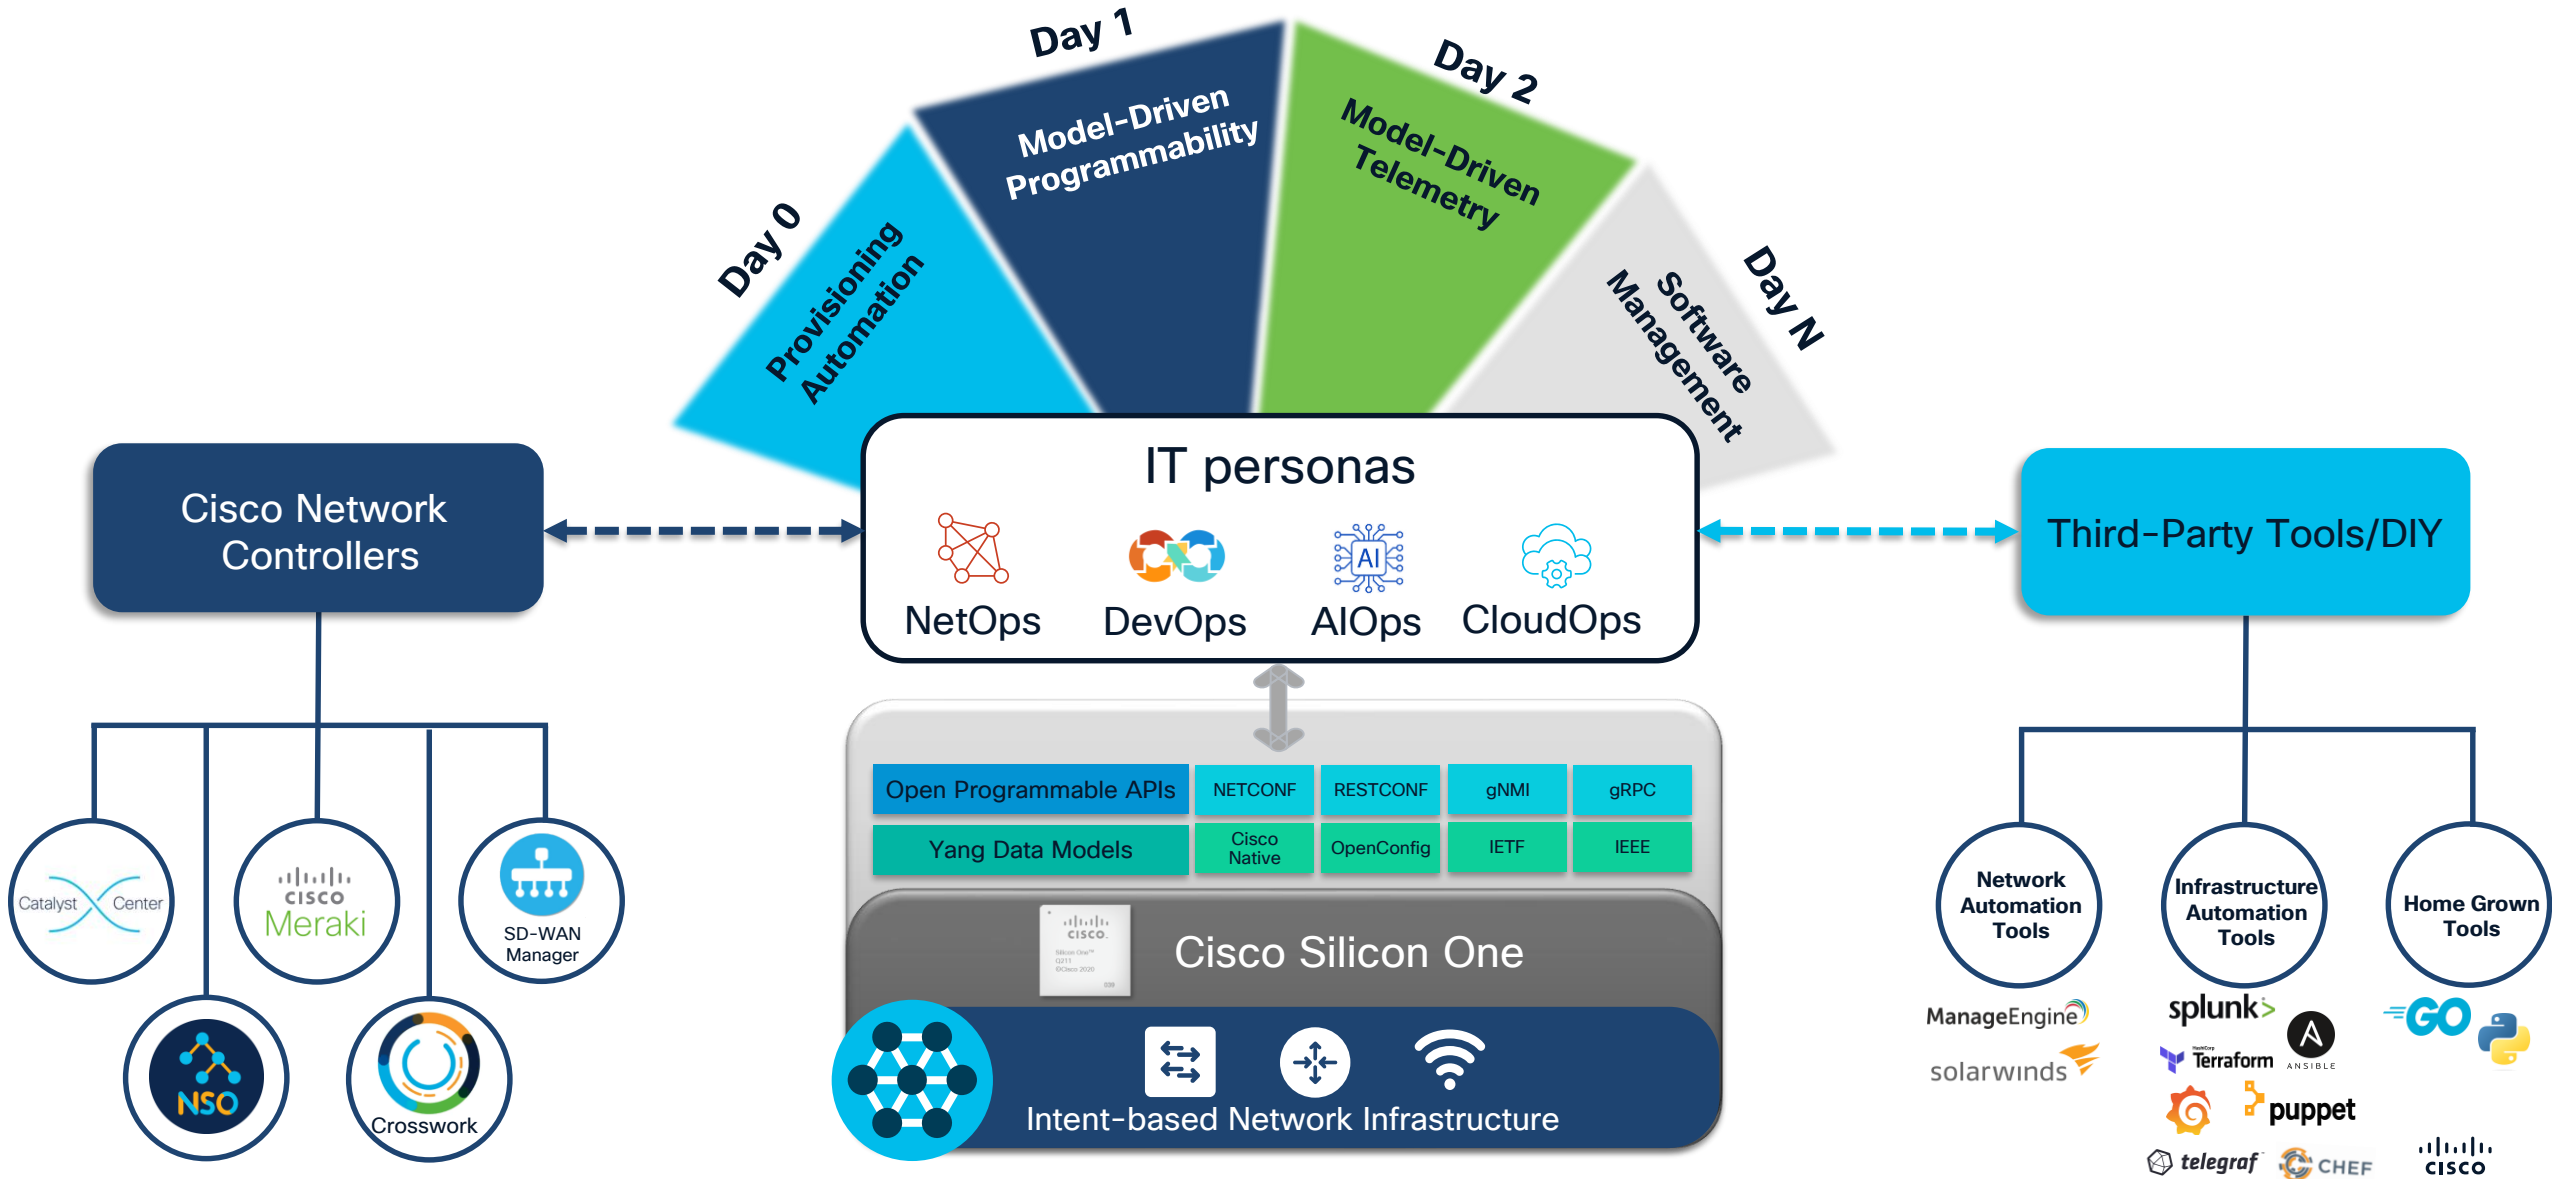

Structured Data: The Fuel for Reliable Automation

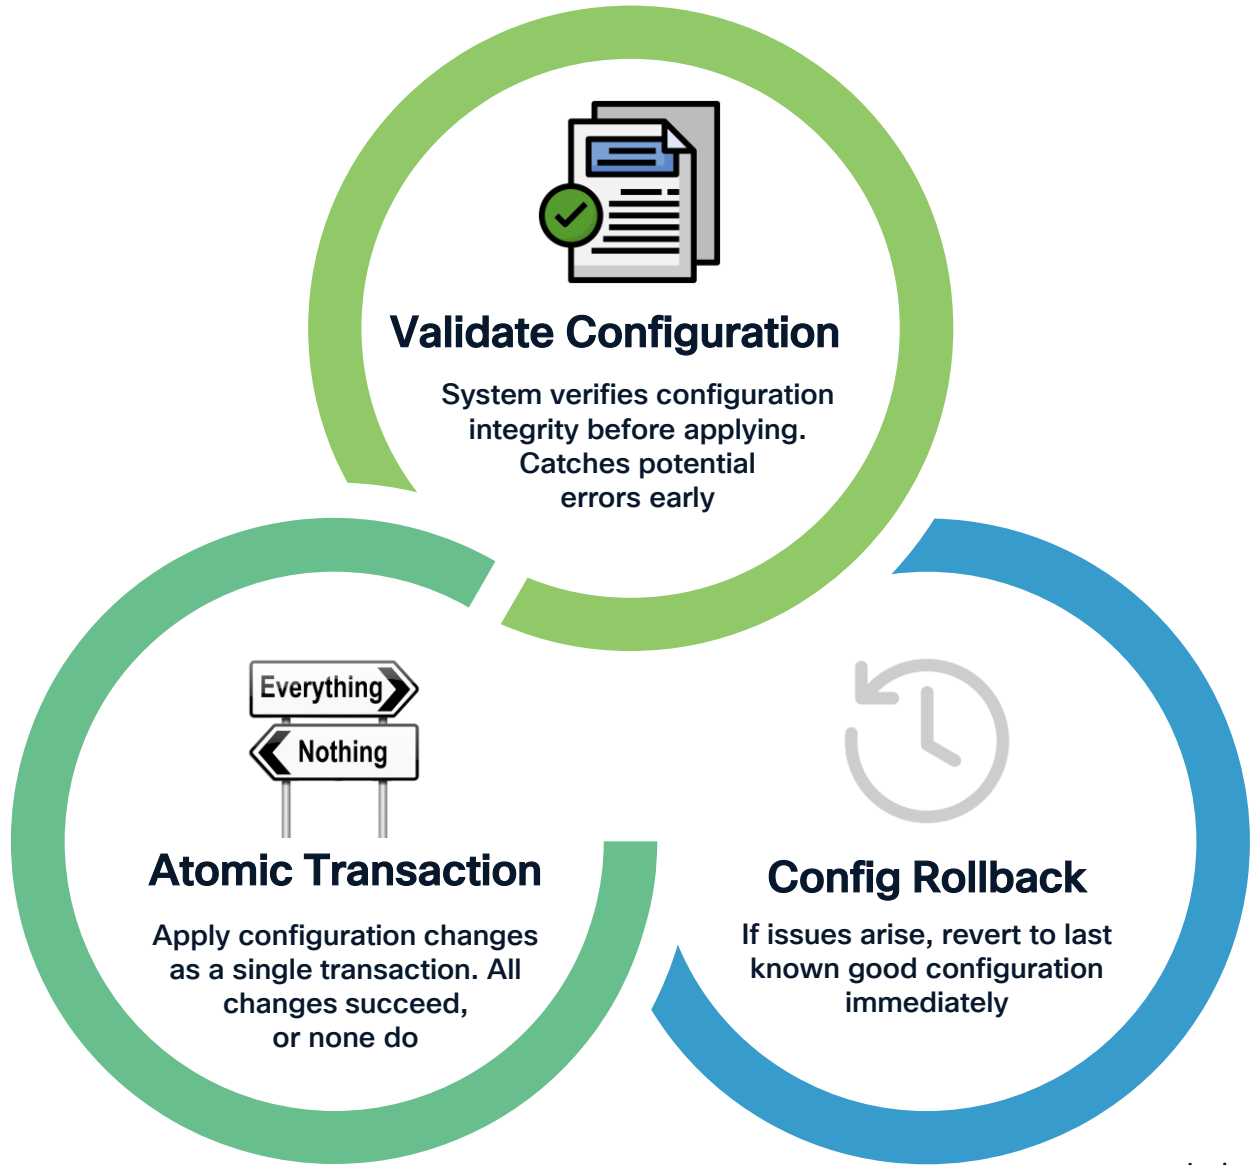

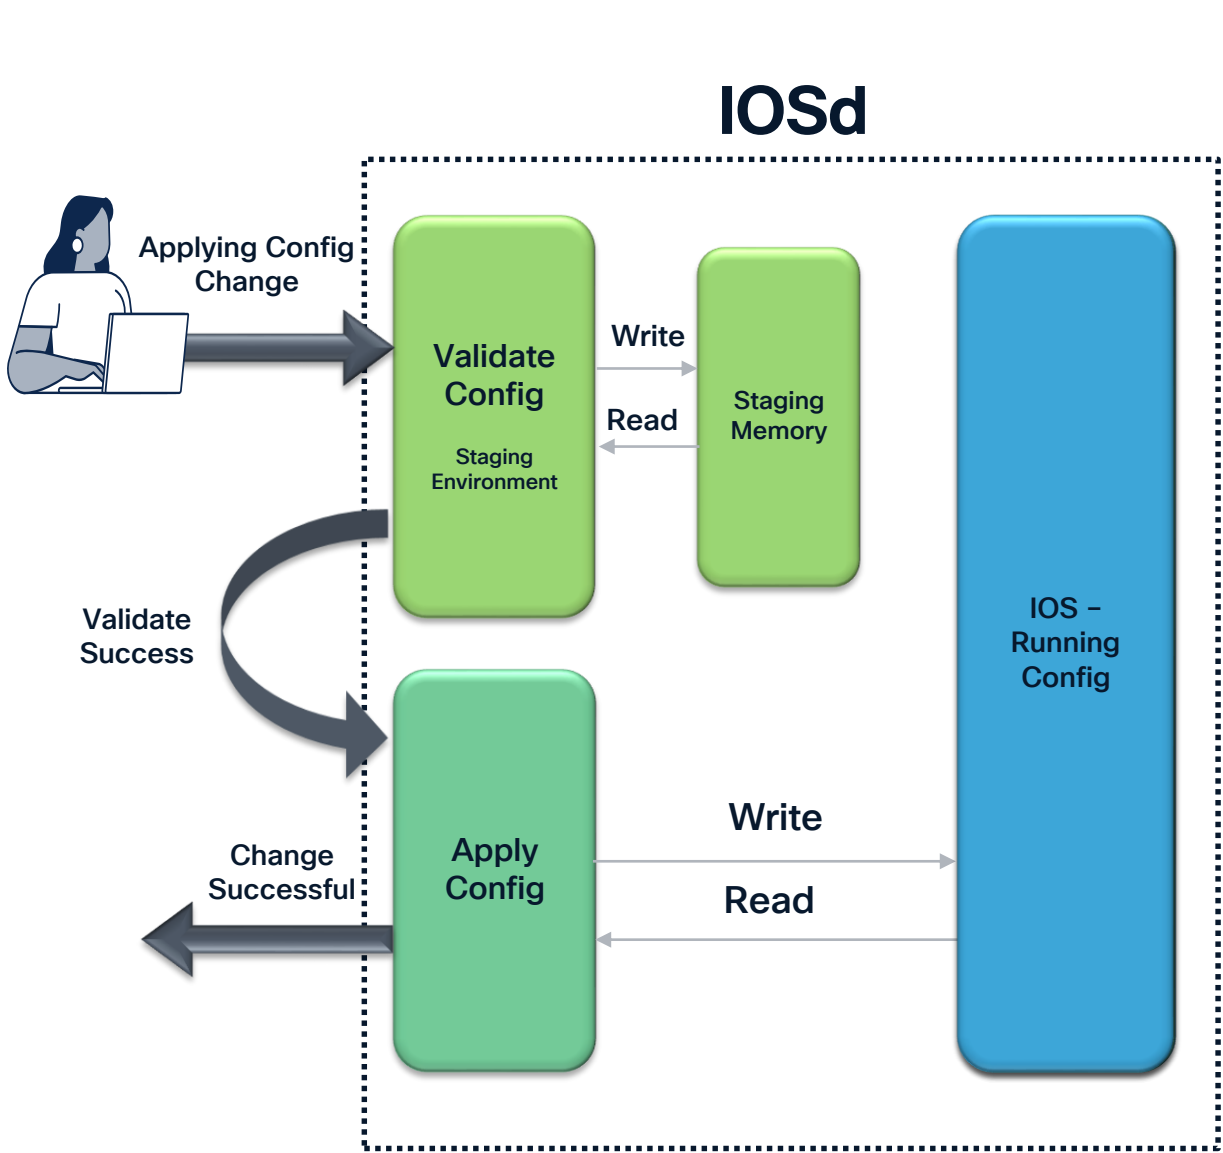

Industry's most open network OS

Receptive to a wide range of management and orchestration strategies

Intro to Atomic Config Replace (ACR)

Introducing Atomic Configuration Replace

Evaluating ACR Benefits

Without Atomic Replace

VS

With Atomic Replace

Manual Verification

Config Verification

Syntax, Semantic and Dependency Verification

Immediate Command Execution -
Incremental Changes

Config Changes

Pre-Validated Configuration Deployment -
Transactional Integrity

Costly configuration errors, Reactive
troubleshooting with high risk of outage

Troubleshooting & Outage

Proactive error prevention and reduced risk of
outage to enable seamless network
management

Errors can leave the network exposed with
higher risk of non-compliant configurations

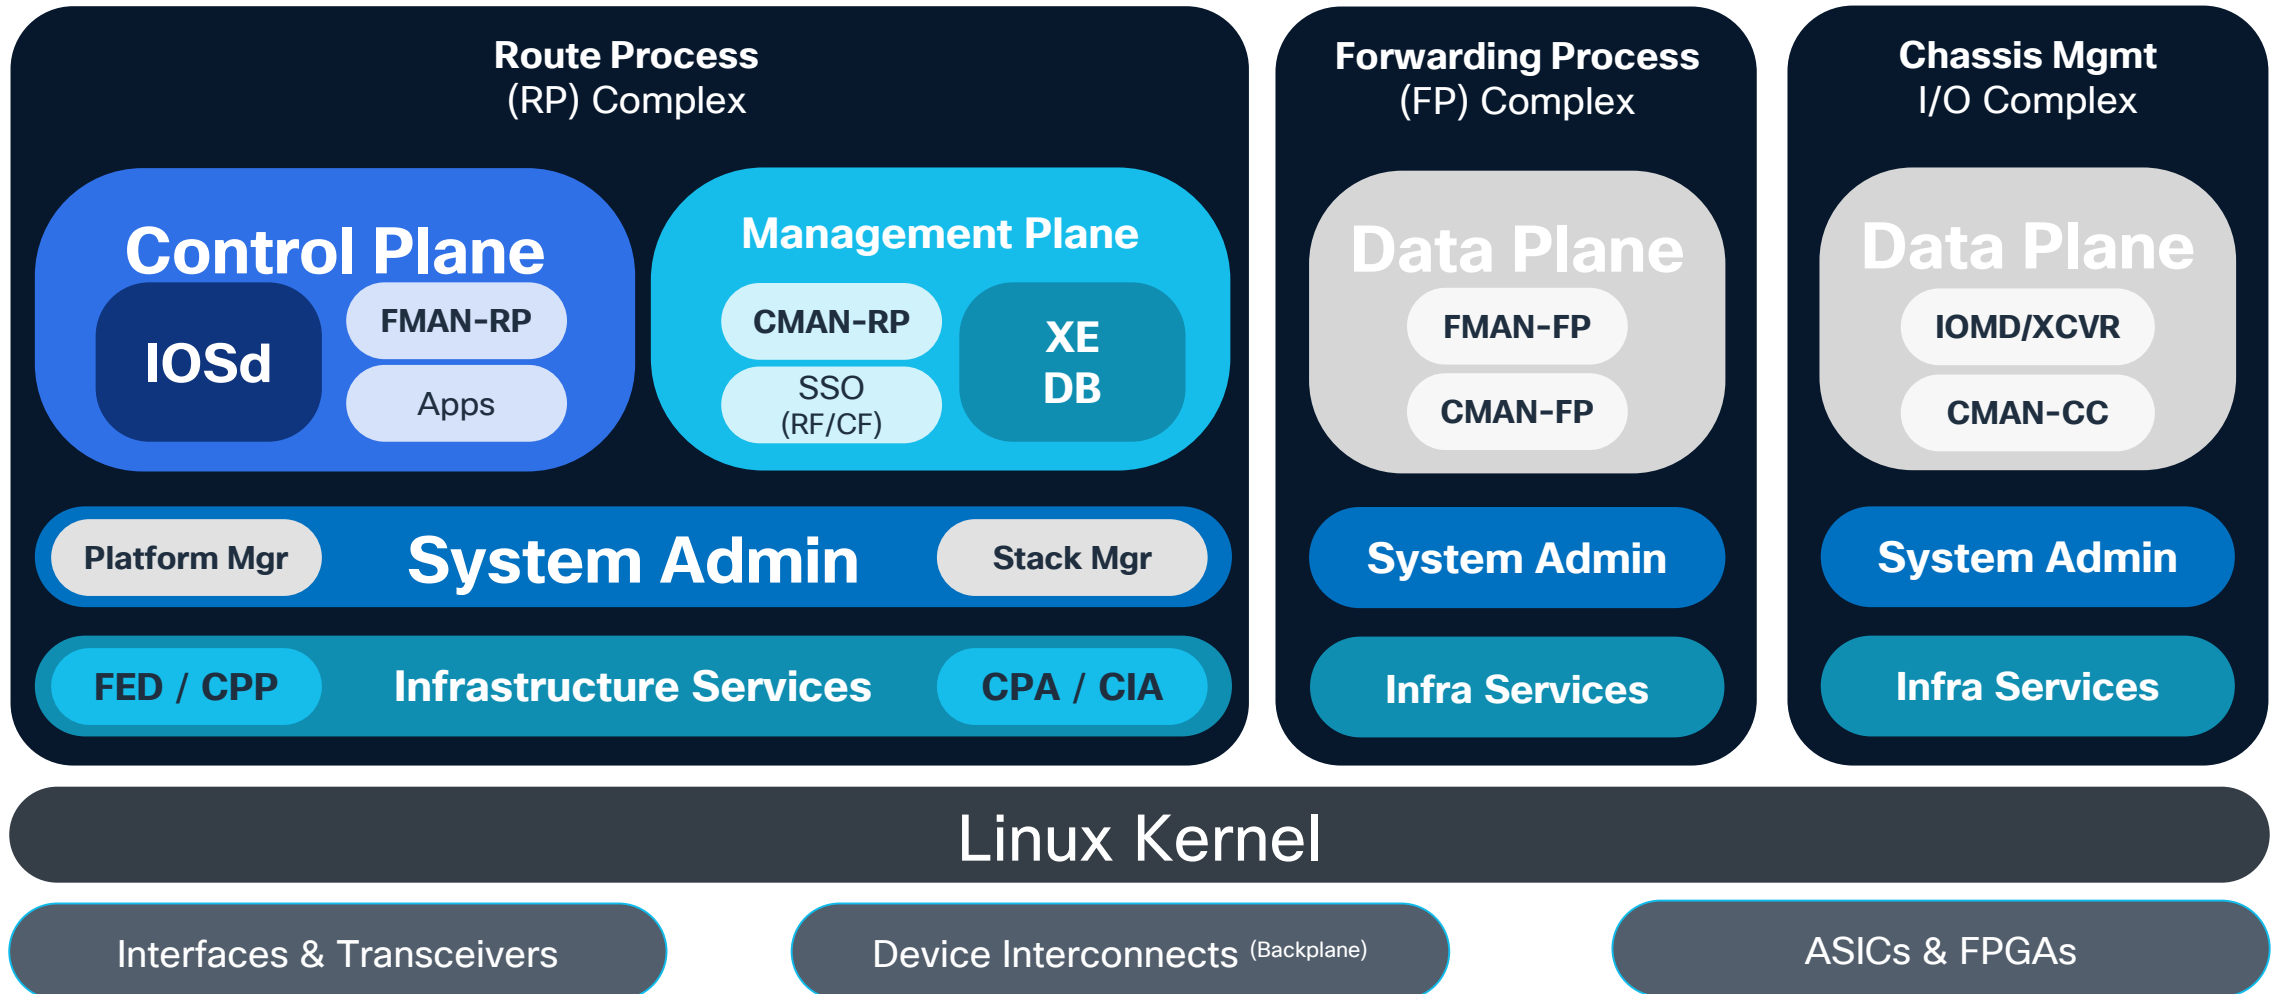

Security & Compliance

Ensures adherence to security policies and
compliance requirements

Cisco IOS XE Architecture

Modularized Components for Software Abstraction

ACR demos

Python Script Using ACR

```
#!/usr/bin/env python
from ncclient import manager
from xml.dom import minidom
from netmiko import ConnectHandler
import difflib
import lxml.etree as et
from lxml.etree import ElementTree as ET
import xmldict
from lxml import etree
from ncclient.operations import RPCError
from datetime import datetime
import time,os

get_modelled_config_running = '''<get-modelled-config-clis xmlns="http://cisco.com/n
<datastore>running</datastore>
</get-modelled-config-clis> '''
get_modelled_config_candidate = '''<get-modelled-config-clis xmlns="http://cisco.com
<datastore>candidate</datastore>
</get-modelled-config-clis> '''

global candidate_flag,pre_filename_shrun,file1_lines,post_filename_shrun,file2_lines

class Device:
    def __init__(self, host, username, password):
        self.host = host
        self.username = username
        self.password = password
        self.__ssh_session = None
        self.__netconf_session = None
```

Detailed Python Script workflow:

1. Start
2. Initialize Device
3. Netconf Connect
4. Discard Changes
5. Get Pre-check Config
6. Apply Config (edit_config)
7. Get Post-check Config
8. Compare Pre & Post Configs
9. Confirmed Commit
10. Get Post-confirmed Commit Config
11. Commit Changes
12. Compare Pre & Final Configs
13. End

ACR Demo 1: Syntax & Dependency Error Isolation

See demo of these steps in the next slide!

1. Send a “full-replace” operation to a C9300 switch to fully replace all the current config on the device with the new config provided in the “target_C9K_config.xml” file
2. Notice syntax error is found in the “target_C9K_config.xml” file by ACR and the exact line of the error is provided
3. Fix the syntax error in the “target_C9K_config.xml” file
4. Send the “full-replace” operation once again to the C9300 switch
5. Verify that the ACR result is “Configuration applied successfully”

ACR Demo 2: rollback config because no confirm commit

See demo of these steps in the next slide!

1. Send a “full-replace” operation to a C9300 switch to fully replace all the current config on the device with the new config provided in the “target_C9K_config.xml” file
2. Notice that although the configuration is valid and applied to the device, the device returns to its previous known state because no “confirm commit” was issued

ACR.py: device configuration & config file

Specify Device (line 244)

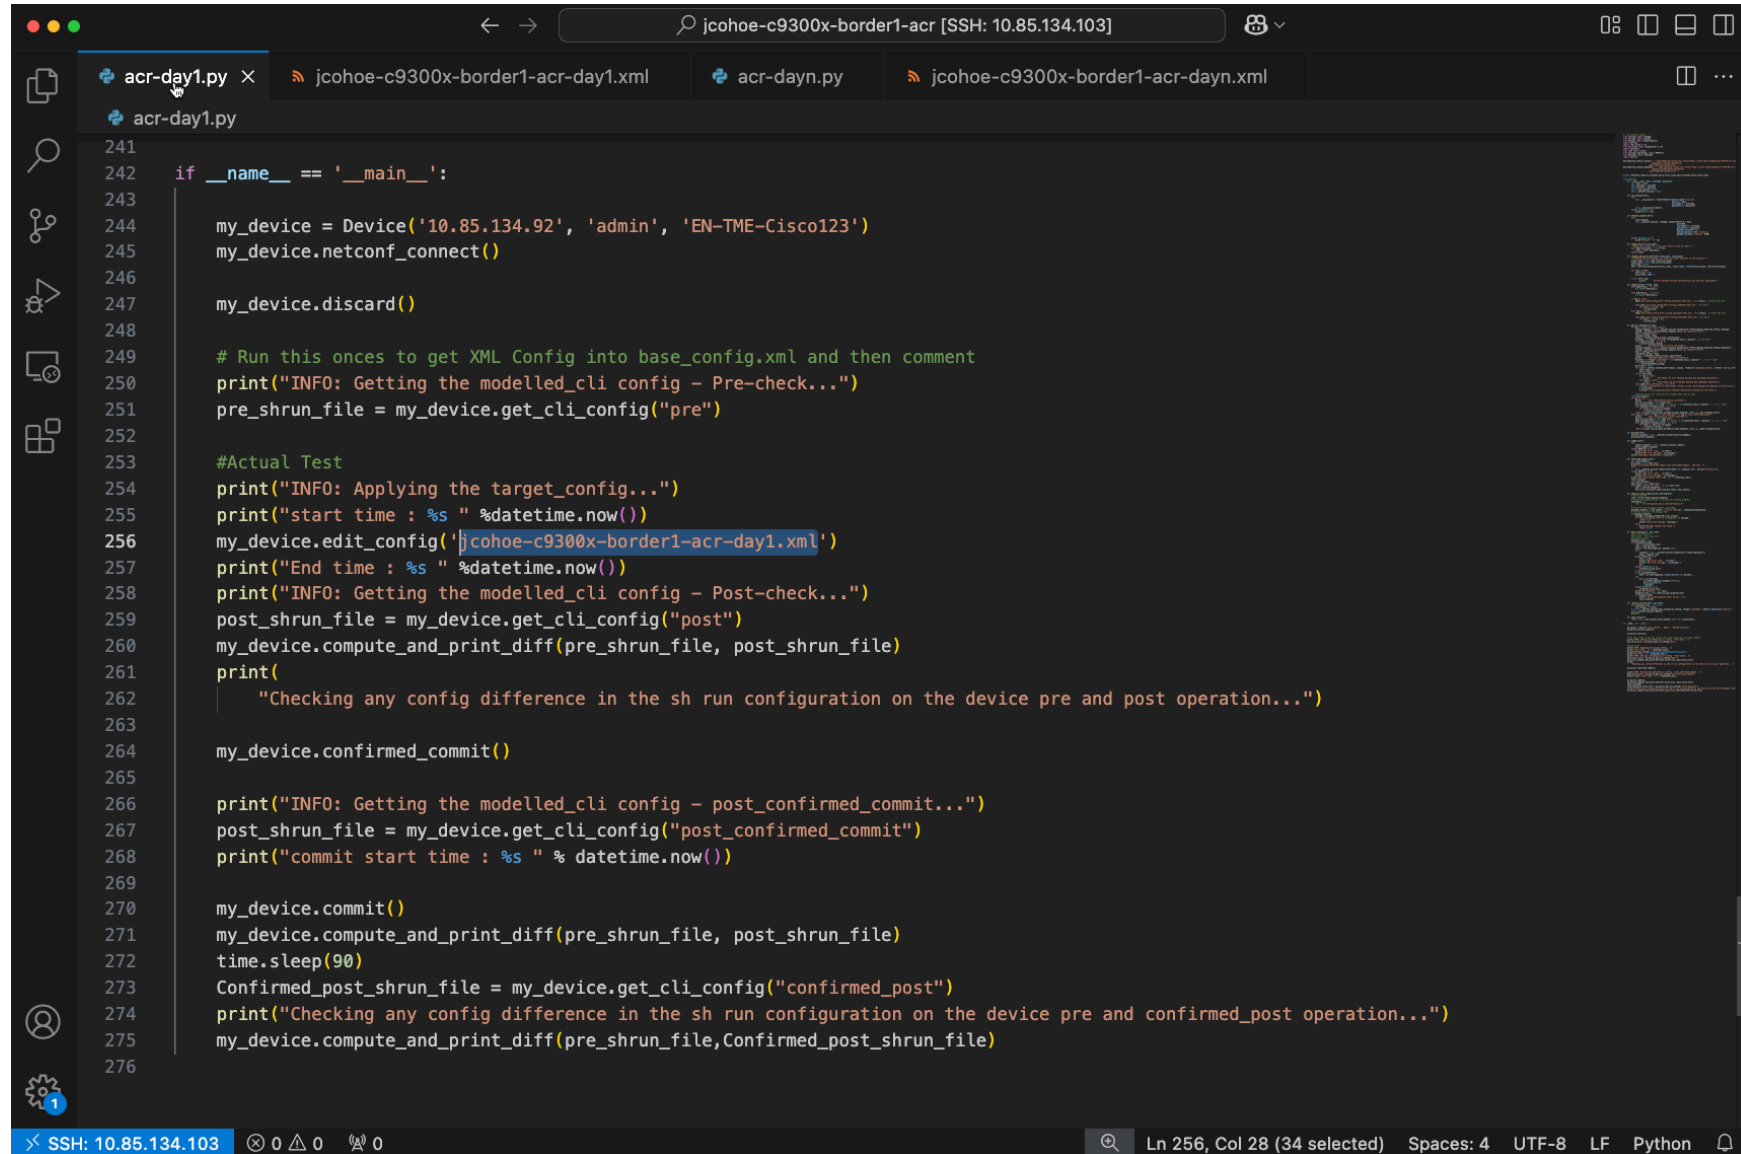

Authentication User/Pass

XML configuration file (line 256)

```
242 if __name__ == '__main__':
243
244     my_device = Device('10.85.134.92', 'admin', 'EN-TME-Cisco123')
245     my_device.netconf_connect()
246
247     my_device.discard()
248
249     # Run this once to get XML Config into base_config.xml and then comment
250     print("INFO: Getting the modelled_cli config - Pre-check...")
251     pre_shrun_file = my_device.get_cli_config("pre")
252
253     #Actual Test
254     print("INFO: Applying the target_config...")
255     print("start time : %s " %datetime.now())
256     my_device.edit_config('jcohoe-c9300x-border1-acr-dayn.xml')
257     print("End time : %s " %datetime.now())
258     print("INFO: Getting the modelled_cli config - Post-check...")
259     post_shrun_file = my_device.get_cli_config("post")
260     my_device.compute_and_print_diff(pre_shrun_file, post_shrun_file)
```

Any current configuration on box to Day – 1

Hostname before:
VNC2-BORDER1-X
Hostname after:
jcohoe-c9300x-border1-acr-day1

The screenshot shows a code editor with a dark theme. The top bar indicates the connection is via SSH to 10.85.134.103. The editor has several tabs open: 'acr-day1.py', 'jcohoe-c9300x-border1-acr-day1.xml', 'acr-dayn.py', and 'jcohoe-c9300x-border1-acr-dayn.xml'. The active tab is 'acr-day1.py', which contains a Python script. The script starts with a standard if __name__ == '__main__': block. It initializes a Device object with IP '10.85.134.92', username 'admin', and password 'EN-TME-Cisco123'. It connects to the device and discards the current configuration. A comment indicates the next step is to get XML config into base_config.xml. The script then prints 'INFO: Getting the modelled_cli config - Pre-check...', gets the pre-shrun file, and prints 'INFO: Applying the target_config...'. It logs the start time and applies the configuration from 'jcohoe-c9300x-border1-acr-day1.xml'. It then prints the end time, gets the post-shrun file, and computes the diff between pre and post shrun files. It prints a message 'Checking any config difference in the sh run configuration on the device pre and post operation...'. It then commits the configuration, gets the post-confirmed commit shrun file, and prints 'INFO: Getting the modelled_cli config - post_confirmed_commit...'. It logs the commit start time, commits the configuration, and computes the diff between pre and post shrun files. It sleeps for 90 seconds, gets the confirmed post shrun file, and prints 'Checking any config difference in the sh run configuration on the device pre and confirmed_post operation...'. Finally, it computes the diff between pre and confirmed post shrun files. The status bar at the bottom shows 'SSH: 10.85.134.103', 'Ln 256, Col 28 (34 selected)', 'Spaces: 4', 'UTF-8', 'LF', and 'Python'.

```
241
242 if __name__ == '__main__':
243
244     my_device = Device('10.85.134.92', 'admin', 'EN-TME-Cisco123')
245     my_device.netconf_connect()
246
247     my_device.discard()
248
249     # Run this onces to get XML Config into base_config.xml and then comment
250     print("INFO: Getting the modelled_cli config - Pre-check...")
251     pre_shrun_file = my_device.get_cli_config("pre")
252
253     #Actual Test
254     print("INFO: Applying the target_config...")
255     print("start time : %s " %datetime.now())
256     my_device.edit_config('jcohoe-c9300x-border1-acr-day1.xml')
257     print("End time : %s " %datetime.now())
258     print("INFO: Getting the modelled_cli config - Post-check...")
259     post_shrun_file = my_device.get_cli_config("post")
260     my_device.compute_and_print_diff(pre_shrun_file, post_shrun_file)
261     print(
262         "Checking any config difference in the sh run configuration on the device pre and post operation...")
263
264     my_device.confirmed_commit()
265
266     print("INFO: Getting the modelled_cli config - post_confirmed_commit...")
267     post_shrun_file = my_device.get_cli_config("post_confirmed_commit")
268     print("commit start time : %s " % datetime.now())
269
270     my_device.commit()
271     my_device.compute_and_print_diff(pre_shrun_file, post_shrun_file)
272     time.sleep(90)
273     Confirmed_post_shrun_file = my_device.get_cli_config("confirmed_post")
274     print("Checking any config difference in the sh run configuration on the device pre and confirmed_post operation...")
275     my_device.compute_and_print_diff(pre_shrun_file, Confirmed_post_shrun_file)
276
```

Hostname after:

jcohoe-c9300x-border1-acr-dayn

[illegible]

NETCONF CLI RPC

YANG model for CLI execution

Original 17.9

Any configure CLI can now be sent within the YANG payload

```
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="101">
  <config-ios-cli-rpc
    xmlns=http://cisco.com/ns/yang/Cisco-IOS-XE-cli-rpc>
    <config-clis>
      interface Loopback111
      description configured-via-CLI-YANG
      no shutdown
    </config-clis>
  </config-ios-cli-rpc>
</rpc>]]>]]>
```

```
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="101">
  <config-ios-cli-trans
    xmlns=http://cisco.com/ns/yang/Cisco-IOS-XE-cli-rpc>
    <clis>
      interface Loopback111
      description configured-via-CONF-D-YANG
      no shutdown
    </clis>
  </config-ios-cli-trans>
</rpc>]]>]]>
```

“cli rpc” sends CLI to the IOS parser

This is similar to configuring CLI on the VTY

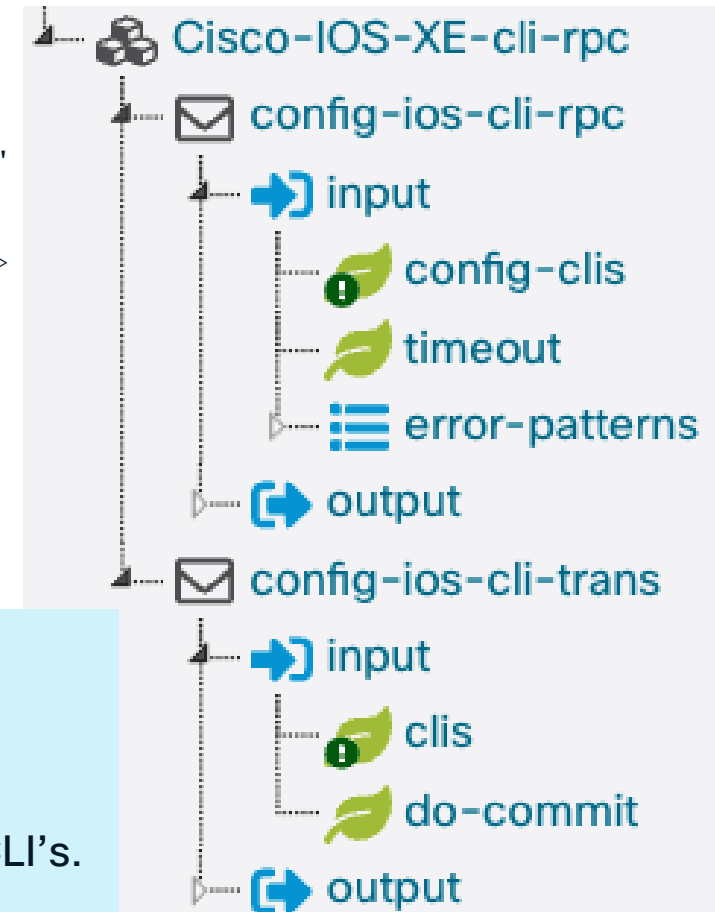

Directly into running-config, then synchronized to ConfD

“transactional cli rpc” sends a list of CLI to ConfD

This is similar to sending edit-config RPCs corresponding to the CLI's.

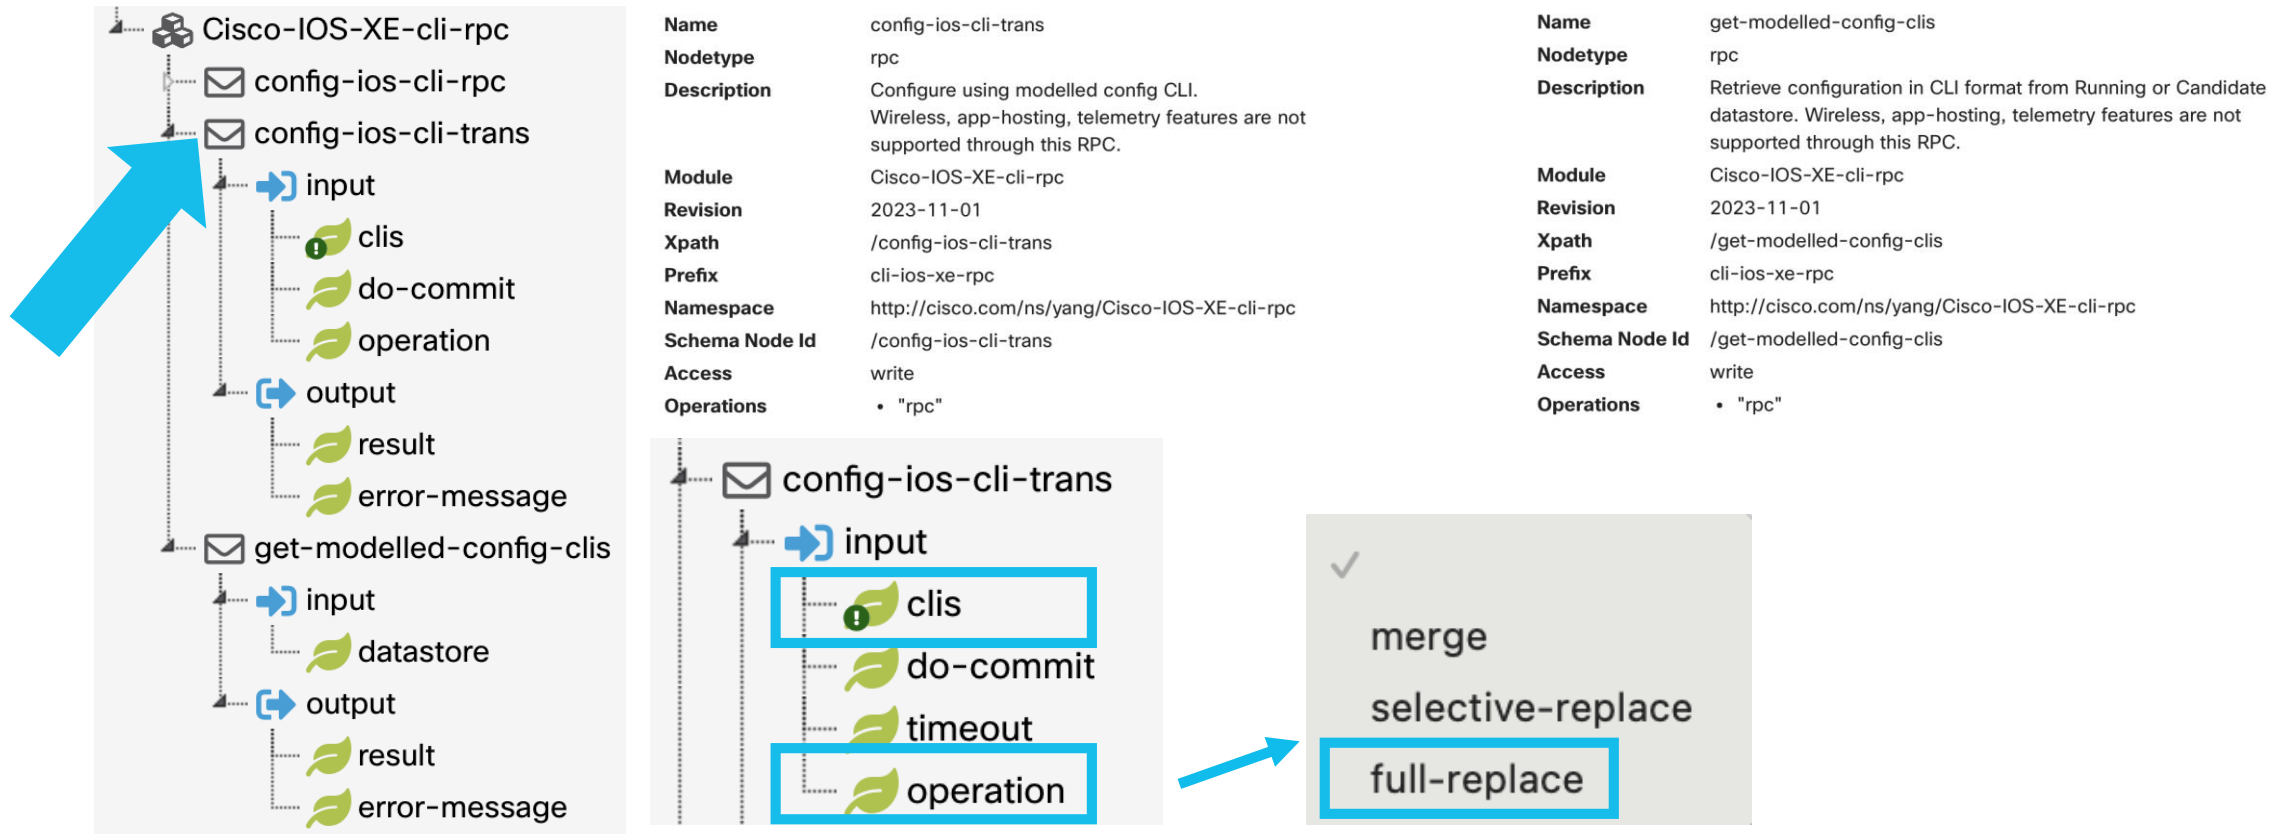

Synchronized from ConfD into the CLI running-config

<https://github.com/YangModels/yang/blob/main/vendor/cisco/xe/1791/Cisco-IOS-XE-cli-rpc.yang>

Cisco-IOS-XE-CLI-RPC.YANG

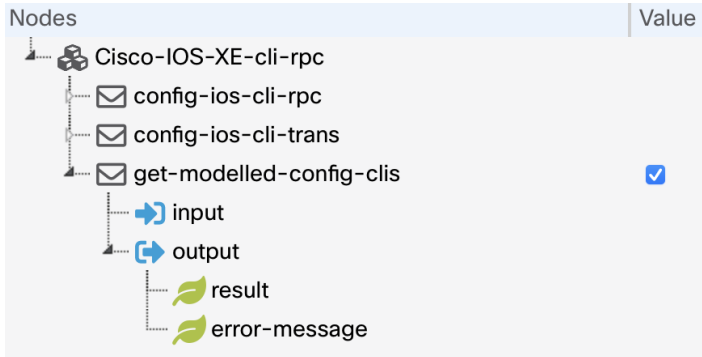

This YANG data model allows sending CLI through the YANG API interfaces
Previously only YANG modelled data was supported

<https://github.com/YangModels/yang/blob/main/vendor/cisco/xen1791/Cisco-IOS-XE-cli-rpc.yang>

Get Modelled Config CLI RPC

- Sending the “get-modelled-config-clis” RPC returns the modelled running-config in CLI format
- Anything not modelled will not be returned (AppH)
- Unsupported model config will be ignored (AppH)
- This is used as the template to update the device with after being modified as needed

```
Sending:
#246
<nc:rpc xmlns:nc="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="urn:uuid:afff"
  <get-modelled-config-clis xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-cli-rpc"/>
</nc:rpc>
```

```
##
```

```
Received message from host
```

```
<rpc-reply xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" xmlns:nc="urn:ietf:params:
<result xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-cli-rpc">version 17.14

RPC:

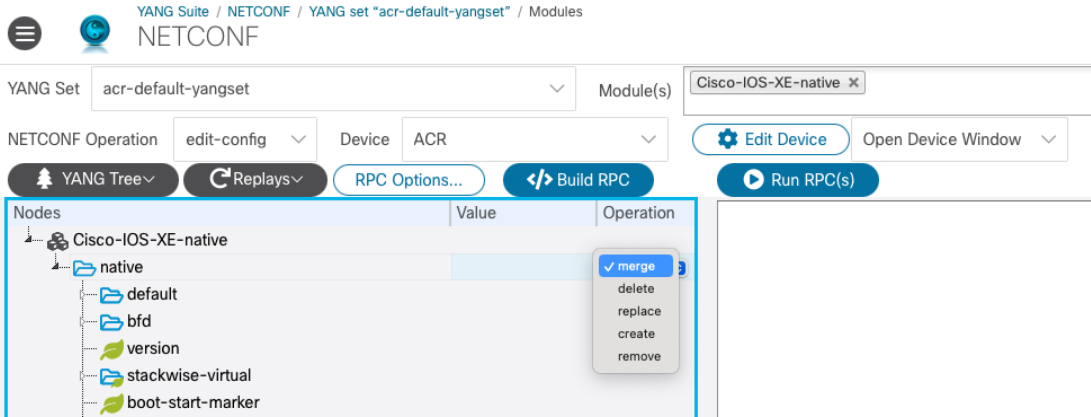

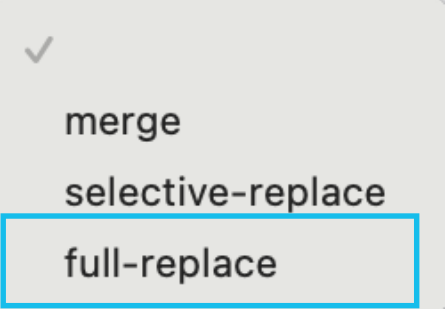

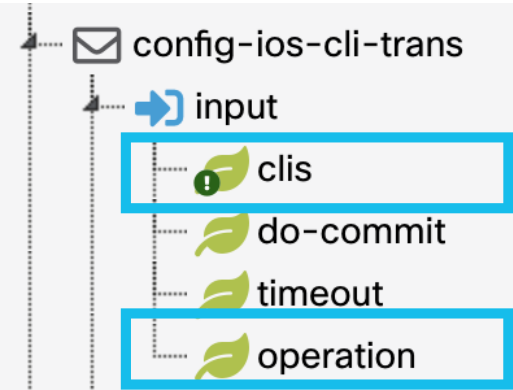

```
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="101">
  <get-modelled-config-clis xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-cli-rpc"/>
</rpc>
```

Atomic Config Replace - ACR

Atomic Config Replace enables full or partial config replace
Ability to send an entire configuration to the device in an XML/JSON payload
Support for traditionally documented CLI's over the CLI-RPC.YANG

Full and selective replace supported as part of
CLI RPC over NETCONF/YANG

Merge, Replace operations supported as part of
NETCONF/YANG

IOS XE NETCONF Datastores

“A Datastore holds a copy of the configuration data that is required to get a device from its initial default state into a desired operational state”

Running is the default and only mandatory Datastore

The Candidate Configuration feature enables support for candidate capability by implementing RFC 6241 with a simple commit option.

The candidate datastore provides a temporary workspace in which a copy of the device's running configuration is stored.

The candidate configuration supports the confirmed commit capability

https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/prog/configuration/1717/b_1717_programmability_cg/m_1717_prog_yang_netconf.html#id_78218

2-Stage Commit

- The 2-Stage commit process includes error and syntax checking
- It enabled a multi-stage commit process with verify before apply
- It is a non-disruptive application processes for the changes – no impact to packet processing
- 2-Stage Commit is only seen when config is rejected as there is no disruption to service

```
VNC2-BORDER1-X#conf t
Enter configuration commands, one per line. End with CNTL/Z.
VNC2-BORDER1-X(config)#yang-interfaces feature ios-two-stage
VNC2-BORDER1-X(config)#end
VNC2-BORDER1-X#sh run | i two-stage
yang-interfaces feature ios-two-stage
VNC2-BORDER1-X#
```

Enable 2-stage commit with
CLI will be simplified to

```
# yang-interfaces feature ios-two-stage
# yang-interfaces features atomic-config
```

Pre-requisites for ACR

On the Catalyst device, the following CLI's must be configured for ACR:

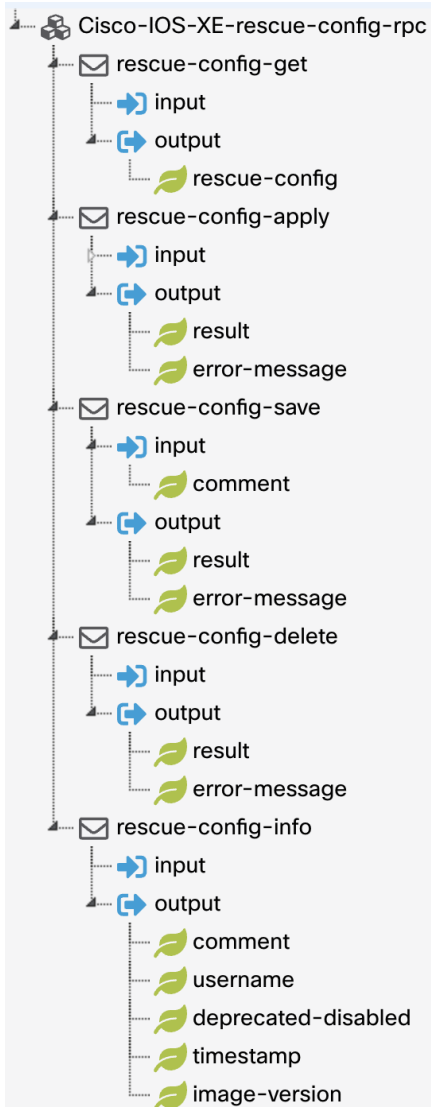

1. netconf-yang
2. netconf-yang feature candidate-datastore
3. yang-interfaces feature atomic-config
4. yang-interfaces feature deprecated disable

```
VNC2-BORDER1-X#sh run | i yang
netconf-yang
netconf-yang feature candidate-datastore
yang-interfaces feature atomic-config
yang-interfaces feature deprecated disable
VNC2-BORDER1-X#
```

```
VNC2-BORDER1-X(config)#netconf-yang fe
VNC2-BORDER1-X(config)#netconf-yang feature ?
  candidate-datastore  Enable the Candidate Datastore
  side-effect-sync     Use the side-effect sync instead of full sync, whenever possible
VNC2-BORDER1-X(config)#netconf-yang feature ca
VNC2-BORDER1-X(config)#netconf-yang feature candidate-datastore ?
  <cr>  <cr>
VNC2-BORDER1-X(config)#netconf-yang feature candidate-datastore
VNC2-BORDER1-X(config)#
```

```

VNC2-BORDER1-X(config)#yang-interfaces feature deprecated ?
  disable  Disable deprecated Yang model elements
  enable   Enable deprecated Yang model elements
VNC2-BORDER1-X(config)#yang-interfaces feature deprecated di
VNC2-BORDER1-X(config)#yang-interfaces feature deprecated disable
VNC2-BORDER1-X(config)#
```

ACR Rescue Config

The rescue config is a golden configuration that can be used to roll back to if an undesired state is reached.

The rescue config RPC YANG model provides options to get, apply, save, delete or access rescue config info.

Rescue Config Get

Request

```
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="101">
  <rescue-config-get xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-rescue-config-rpc"/>
</rpc>
```

Reply

```
<?xml version="1.0" ?>
<rpc-reply message-id="urn:uuid:58dc2e7f-1393-4628-b87b-87a063de683c" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" xmlns:nc="urn:ietf:params:xml:ns:netconf:base:1.0">
  <rescue-config xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-rescue-config-rpc"><config xmlns="http://tail-f.com/ns/config/1.0">
    <cloud-services-cfg-data xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-cloud-services-cfg">
      <cloudm-config>
      </cloudm-config>
    </cloud-services-cfg-data>
    <native xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-native">
      <version>17.19</version>
      <memory>
        <free>
          <low-watermark>
            <processor>105089</processor>
          </low-watermark>
        </free>
      </memory>
    </native>
  </rescue-config>
</rpc-reply>
```

CLI

```

Ready to get hands-on?

ACR: Scope

- Validates only device-level configurations
 - Network-level configurations are not validated
- Pre-Release Feature: Available for Early Field Trials
- Supported on Catalyst 9300, 9500 & 9800 (WLC)
 - 9200, 9400 & 9600 support coming soon!
- Supported on programmable interfaces
 - Exclusively with NETCONF & NETCONF CLI RPC
- Works with specific set of features

Early Field Trials for Atomic Config
Replace

Category	Features
Basic L2	Ethernet interfaces, Port channel interfaces, Port channel, Spanning tree, LACP, Logging, Err-disable
L3 and SVL	VRF, VLAN interfaces, Loopback interfaces, IP, IP DHCP, IP Route, MPLS, ARP, Track
Policy (Security and Others)	Class-map, Policy-map, Route-map, AAA, Ssh, IP ACL, TACACS, Crypto, certs etc, Username
Management, Device configuration and access etc.	HTTP, SNMP, Banner, Line, NTP, Monitor, Call home, Hostname, Service, Archive, PnP, Event Manager
Advanced features	Post-deployment rollback, Config Diff, Commit Comment, ISSU, Manage static imperative device objects

Cisco YANG Suite

YANG API Testing and Validation Environment

Construct and test YANG based APIs over
NETCONF, RESTCONF, gRPC and gNMI

IOS XE / IOS XR / NX OS platforms

On-Demand Learning Lab with YANG Suite in Docker
<https://developer.cisco.com/learning/labs/intro-yangsuite/>

The screenshot displays the Cisco YANG Suite web interface. The top section, titled 'Explore YANG Models', shows a tree of nodes for the 'Cisco-IOS-XE-interfaces-oper' module. The 'Node Properties' table lists details for the 'statistics' node, including its name, nodetype, description, module, revision, xpath, prefix, and namespace. The bottom section, titled 'NETCONF', shows the 'YANG Tree' and a 'Value' field for the 'string' node. The 'RPC Options...' button is highlighted.

Use Cases:

EVPN:

Ansible with CLI deployment of EVPN solutions
EVPN management over RESTCONF/YANG with Postman
Declarative EVPN fabric management with Terraform

Tooling and Integrations

YANG Suite

- NETCONF/RESTCONF/gNMI API
 - Ansible integration
- NETCONF/gNMI Dial-In Telemetry
- gRPC Dial-Out Telemetry receiver

Telemetry

- TIG stack in Docker
- Grafana dashboard for device health

Postman / RESTCONF

- EVPN fabric API calls

Terraform/RESTCONF

- Declarative EVPN fabric management

Ansible

- EVPN solution enablement using CLI

Model Driven Telemetry

Telemetry configuration with CLI and YANG Suite
Collection with TIG_MDT container and tooling

DevNet Sandbox – overview for Campus and Enterprise

<https://developer.cisco.com/site/sandbox/>

1. **Reservable Physical**: C9200, C9300, C9300X including stacks

About to go into production April 2025

Useases: Application Hosting, Power telemetry, etc

2. **Reservable Virtual**: C8KV Router + NX + XR + Ubuntu VM

Useases: Enterprise topology, dual-ZTP

3. **Always-On**: C9KV

Usecase: Virtual switch for basic config validation usecases

DNS: devnetsandboxiosxec9k.cisco.com

“Launch Sandbox” to get login credentials

4. **Always-On**: C8KV

DNS is devnetsandboxiosxe.cisco.com

5. **Reservable** Catalyst Center (Physical & Virtual)

CML and C9KV, ISE for SDA

C9KV user is priv15 and has full permissions, there is reset automation for when you break it now too 😊

Additional enablement labs:

1. YANG Suite “Learning Lab 2.0”

Interactive guide with tool running in Docker container

“YANG Suite as a service”

2. dCloud Programmability Lab

EVPN topology with all programmability features enabled

Launch Sandbox ↗

Catalyst 9000 Always-On Sandbox

Always-On sandbox for Cat9K. Reserve to create unique credentials and access the Cat9000v switch.

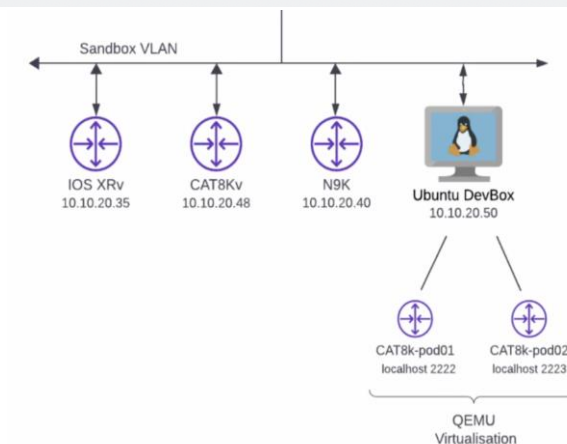

Always-On

Networking

NEW

Launch

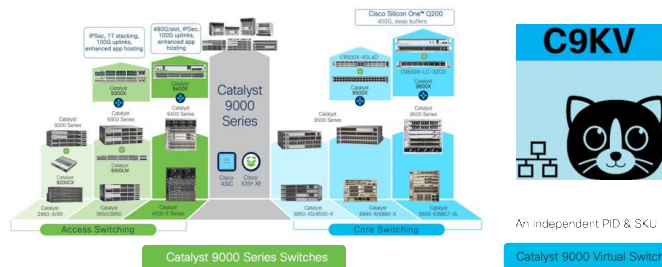

C9KV Always-On with reservation

New C9kV Sandbox now available!

Sandbox access: https://devnetsandbox.cisco.com/DevNet/catalog/Cat9k-Always-On_cat9k-always-on
Hostname: devnetsandboxiosxec9k.cisco.com

C9KV Sandbox Capabilities:

- Cisco IOS XE 17.15.1 Virtual Catalyst 9000 UADP 8 port switch
- “Always-On” outside of the Cisco Network DMZ in a colocation on hardware in VMWARE/OVA
- Accessible with reservation through Cisco’s Developer Enablement platform
- Reservable by anybody including customers, partners and external
- Enabled for **read-only usecases** with SSH/CLI and API: NETCONF/YANG, RESTCONF, gNMI
- Support for Model-Driven Telemetry and basic configuration changes through the API
- Supports 40 concurrent sessions
